MSC23V13258D-xxBS2

1,048,576-word x 32-bit DYNAMIC RAM MODULE : FAST PAGE MODE TYPE WITH EDO

DESCRIPTION

The MSC23V13258D-xxBS2 is an 1,048,576-word x 32-bit CMOS dynamic random access memory module which is composed of two 16Mb(1Mx16) DRAMs in TSOP packages mounted with two decoupling capacitors. This is an 100-pin dual in-line memory module. This module supports any application where high density and large capacity of storage memory are required.

FEATURES

· 1,048,576-word x 32-bit organization
· 100-pin Dual In-line Memory Module
· Gold tab
· Single 3.3V power supply, ±0.3V tolerance
· Input : LVTTL compatible
· Output : LVTTL compatible, 3-state
· Refresh : 1024cycles/16ms
· /CAS before /RAS refresh, hidden refresh, /RAS only refresh capability
· Fast page mode with EDO, read modify write capability
· DQ pins have 10ohm series resistor
· Serial Presence Detect

Notes: 1. A start-up delay of 200µs is required after power-up, followed by a minimum of eight initialization cycles (/RAS only refresh or /CAS before /RAS refresh) before proper device operation is achieved.

2. The AC characteristics assume t_T = 2ns.

3. V_{IH}(Min.) and V_{IL}(Max.) are reference levels for measuring input timing signals. Transition times (t_T) are measured between V_{IH} and V_{IL}.

4. This parameter is measured with a load circuit equivalent to 1 TTL load and 100pF.
The output timing reference levels are V_{OH} = 2.0V and V_{OL} = 0.8V.

5. Operation within the t_{RCD}(Max.) limit ensures that t_{RAC}(Max.) can be met.
t_{RCD}(Max.) is specified as a reference point only. If t_{RCD} is greater than the specified t_{RCD}(Max.) limit, then the access time is controlled by t_{CAC}.

6. Operation within the t_{RAD}(Max.) limit ensures that t_{RAC}(Max.) can be met.
t_{RAD}(Max.) is specified as a reference point only. If t_{RAD} is greater than the specified t_{RAD}(Max.) limit, then the access time is controlled by t_{AA}.

7. t_{CEZ}(Max.), t_{REZ}(Max.), t_{WEZ}(Max.) and t_{OEZ}(Max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.

8. t_{CEZ} or t_{REZ} must be satisfied for open circuit condition.

9. t_{RCH} or t_{RRH} must be satisfied for a read cycle.

10. t_{WCS}, t_{CWD}, t_{RWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$(Min.), then the cycle is an early write cycle and the data out will remain open circuit (high impedance) throughout the entire cycle. If $t_{CWD} \geq t_{CWD}$(Min.), $t_{RWD} \geq t_{RWD}$(Min.), $t_{AWD} \geq t_{AWD}$(Min.) and $t_{CPWD} \geq t_{CPWD}$(Min.), then the cycle is a read modify write cycle and data out will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, then the condition of the data out (at access time) is indeterminate.
