

# W528XXX

## ADPCM VOICE SYNTHESIZER (PowerSpeech)<sup>TM</sup>

### GENERAL DESCRIPTION

The W528xxx family are programmable speech synthesis ICs that utilize the ADPCM coding method to generate all types of voice effects.

The W528xxx's LOAD and JUMP commands and four programmable registers provide powerful user-programmable functions that make this chip suitable for an extremely wide range of speech IC applications.

The W528xxx family includes 12 kinds of bodies which are the same except for the voice duration shown below:

BODY	W528S03	W528S05	W528S08	W528S10	W528S12	W528S15
Second	3 Sec	5 Sec	8 Sec	10 Sec	12 Sec	15 Sec
BODY	W528S20	W528S25	W528S30	W528S40	W528S50	W528S60
Second	20 Sec	25 Sec	30 Sec	40 Sec	50 Sec	60 Sec

Note: The voice durations are estimated by 6.4KHz sampling rate.

### FEATURES

- Programmable speech synthesizer
- Wide operating voltage range: 2.4 to 5.5 volts
- 4-bit ADPCM synthesis method
- Provides 4 direct trigger inputs that can easily be extended to 8 or 12 matrix trigger inputs
- Two trigger input debounce times (50 mS or 400  $\mu$ S) can be set
- Provides up to 2 LEDs and 3 STOP outputs
- Every LED pin can drive 3 LEDs simultaneously
- LED flash frequency: 3 Hz
- AUD output current: 5 mA
- Flexible functions programmable through the following:
  - LD (load), JP (jump) commands
  - Four registers: R0, EN, STOP, and MODE
  - Conditional instructions
  - Speech equation
  - END instruction
  - Global repeat (GR) setting
  - Output frequency and LED flash type setting
- Programmable power-on initialization (POI) (can be interrupted by trigger inputs)

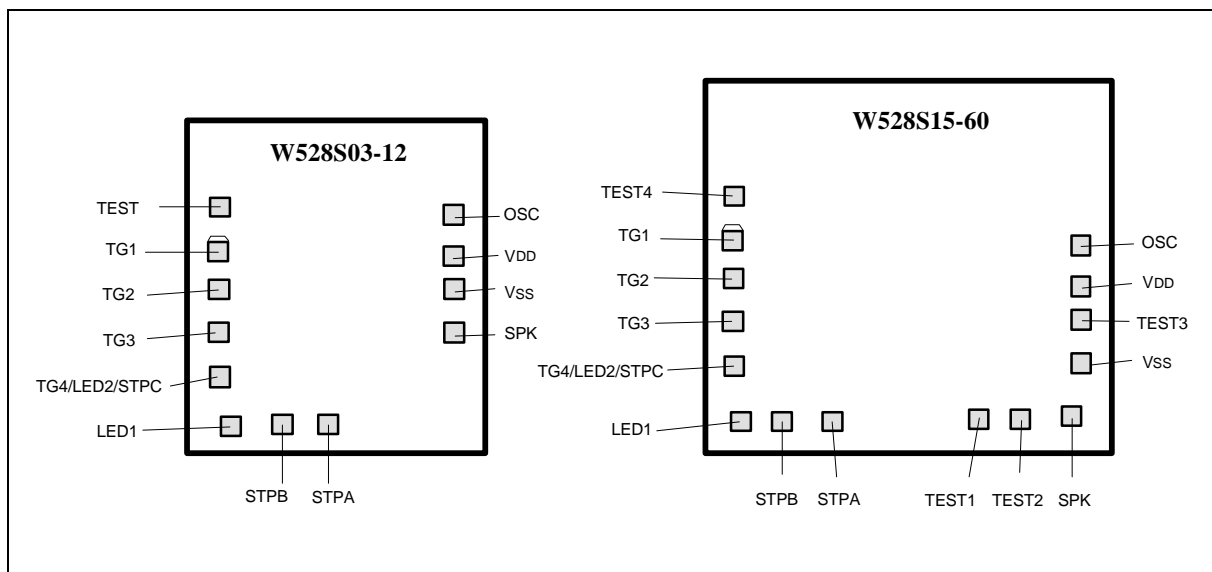

Publication Release Date: March 1999

Revision A1

- POI delay time of 160 mS ensures stable voltage when chip is powered on
- Can be programmed for the following functions:
  - Interrupt or non-interrupt for rising or falling edge of each trigger pin (this feature determines retriggerable, non-retriggerable, overwrite, and non-overwrite features of each trigger pin)
  - Four playing modes:
    - One Shot (OS)
    - Level Hold (LH)
    - Single-cycle level hold (S\_LH)
    - Complete-cycle level hold (C\_LH)
  - Stop output signal setting
  - Serial, direct, or random trigger mode setting
- Four frequency options (4/4.8/6/8 KHz) and LED On/Off control can be set independently in each GO instruction of speech equation
- Independent control of LED1 and LED2
- Total of 256 voice group entries available for programming
- Provides the following mask options:
  - LED flash type: synchronous/alternate
  - LED1 section-controlled: Yes/No
  - LED2: section-controlled/STPC-controlled
  - LED volume-controlled: No/Yes

## PAD CONFIGURATIONS

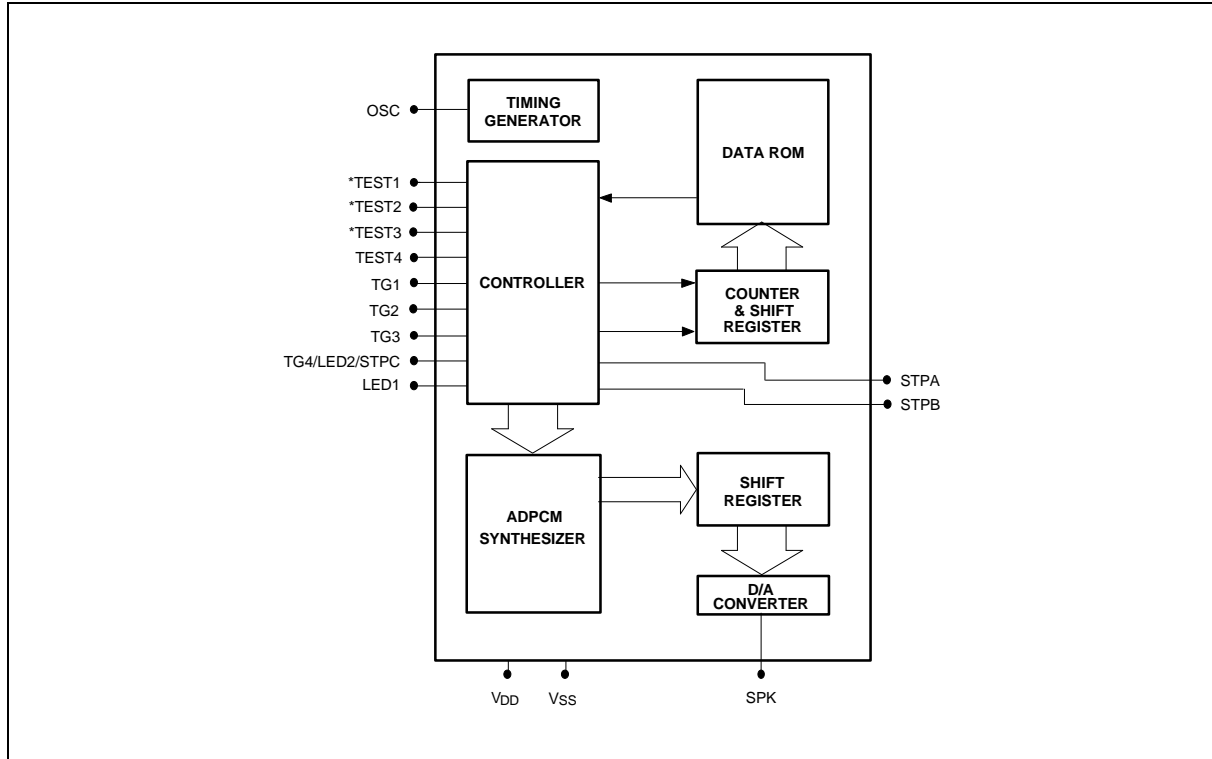

**PAD DESCRIPTION**

PAD NAME	I/O	FUNCTION
TG1	I	Trigger Input 1
TG2	I	Trigger Input 2
TG3	I	Trigger Input 3
TG4/LED2/STPC	I/O	Trigger Input 4 or LED 2 or Stop Signal C
LED1	O	LED 1
STPB	O	Stop Signal B
STPA	O	Stop Signal A
SPK	O	Current Output for Speaker
Vss	-	Negative Power Supply
VDD	-	Positive Power Supply
OSC	I	Oscillation Frequency Control
*Test1	-	Test Pin
*Test2	-	Test Pin
*Test3	-	Test Pin
Test4	-	Test Pin

\* These pads only exist in W528S15~60.

## BLOCK DIAGRAM

\* These pins only exist in W528S15~60.

## FUNCTIONAL DESCRIPTION

The W528xxx family provides up to four direct trigger pins, which can be extended to eight or twelve matrix trigger inputs, up to three stop signal output pins, an LED section control, and powerful programmable features. The JUMP and LOAD commands and four programmable registers can be used to program the desired playing mode, stop output signal form, LED flash type, and trigger pin interrupt modes.

The chip's programmable features can also be used to develop new, customized functions for a wide variety of innovative applications.

### A. Instruction Set Description

This section describes three types of instructions:

- Unconditional instructions, which are executed immediately after they are issued.
- Conditional instructions, which are executed only when the conditions specified in the instructions are satisfied.
- END instruction, which is used to stop all device activity.

Instructions are programmed by writing LOAD and JUMP commands into the R0, EN, STOP, and MODE registers.

## Unconditional Instructions:

### 1. LOAD (LD) Command:

LD R0, value:

This instruction is used to load a voice-group entry value into register R0. The voice-group entry value may range from 0 to 255. The initial value of the R0 register is "00000000."

LD EN, operand:

This instruction is used to define the trigger interrupt settings by loading the operand message into register EN. The initial value of the EN register is "11111111."

- The operand is an 8-bit value that can be entered in decimal (default) or hexadecimal (with "0x" as a prefix).
- EN is an 8-bit register that is used to enable/disable the rising/falling edge of each of the four trigger inputs.

The 8 bits correspond to the rising/falling edges of the triggers as shown below:

Bit:	7	6	5	4	3	2	1	0
TG:	4R	3R	2R	1R	4F	3F	2F	1F

where "nR/F" represents the rising/falling edge of the n-th trigger pin.

- When any one of the eight bits is set to "1" (default), the corresponding trigger will interrupt the current state at the edge indicated. When the bits are set to "0," the triggers will be disabled.
- The voice group entry addresses correspond to the interrupt vectors as follows:

TG:	4R	3R	2R	1R	4F	3F	2F	1F
Group:	7	6	5	4	3	2	1	0

### EXAMPLE:

The instruction "LD EN, 0x41" is programmed.

### EXPLANATION:

- "41" is a hexadecimal value equal to the binary value "0100 0001."
- These 8 bits of data represent the following trigger interrupt settings:

4R,	3R,	2R,	1R,	4F,	3F,	2F,	1F
0	1	0	0	0	0	0	1

### RESULT:

- When the rising edge of TG3 (3R) is activated, the EN register will cause TG3 to interrupt the current playing state and jump immediately to voice group 6, the voice group that corresponds to 3R.

- b. When the falling edge of TG1 goes active, the EN register will cause TG1 to interrupt the current playing state and jump immediately to voice group 0, the voice group that corresponds to 1F.
- c. No action will be taken when the other trigger pins are pressed, because the corresponding bits are set to "0."

LD STOP, operand:

This instruction loads the operand message into the STOP register to set the output levels of the stop signals. The initial value of the STOP register is "XXXXX111."

- a. This register is used to program the output levels of the three STOP signals, STPA, STPB, and STPC. Only three of the bits in the register are used, as shown below (an "X" indicates "Don't care"):

Bit:	7	6	5	4	3	2	1	0
Stop:	X	X	X	X	X	STPC	STPB	STPA

- b. When a particular STOP bit is set to "1," The corresponding stop signal will be a high output; when a bit is set to "0," the corresponding stop signal will be a low output.

EXAMPLE:

The instruction "LD STOP, 0x43" is programmed.

EXPLANATION:

- a. "43" is a hexadecimal value equal to a binary value of "0100 0011."
- b. These 8 bits of data represent the following settings:

X,	X,	X,	X,	X,	STPC,	STPB,	STPA
0	1	0	0	0	0	1	1

RESULT:

- a. The STPA and STPB outputs will be high outputs.
- b. The STPC signal will be a low output.
- c. The sixth bit "1" is a "Don't Care" bit and so has no effect on the stop signal output settings.

LD MODE, operand:

This instruction is used to select various operating modes. It loads an operand message into the MODE register to select one mode from each of four pairs of modes, which correspond to bits 4 through 7 of the register (bits 0 to 3 are "Don't Care" bits). The four pairs of modes and the corresponding bits are as follows:

Bit:	7	6	5	4	3	2	1	0
MODE:	Flash/DC	LED2/STPC	TG4/LED2_STPC	50 mS/400 $\mu$ S	X	X	X	X

A "1" for one of these bits selects the first of the pair of modes indicated; a "0" selects the second of the pair. The initial value of the mode register is "1111XXXX."

## EXAMPLE 1:

The four bits are programmed as "1111," so that the eight bits of the register are as follows (an "X" indicates a "Don't Care" bit):

Flash/DC,	LED2/STPC,	TG4/LED2_STPC,	50 mS/400 $\mu$ S,	X,	X,	X,	X
1	1	1	1	X	X	X	X

## RESULT:

The mode settings are as follows:

- Pin 4 (TG4/LED2\_STPC) is configured as a trigger pin (TG4), and the LED2/STPC option will be ignored.
- The LED is set as a flash type, with a flash frequency of 3 Hz.
- The debounce time of the trigger inputs is set to 50 mS.

## EXAMPLE 2:

The four bits are programmed as "0000," so that the eight bits of the register are as follows (an "X" indicates a "Don't Care" bit):

Flash/DC,	LED2/STPC,	TG4/LED2_STPC,	50 mS/400 $\mu$ S,	X,	X,	X,	X
0	0	0	0	X	X	X	X

## RESULT:

The mode settings are as follows:

- Pin 4 (TG4/LED2\_STPC) is configured as either the LED2 or STPC output (determined by bit 6, LED2/STPC; see next item).
- Pin 4 is configured as the STPC output pin.
- LED will be lit constantly during operation.
- The debounce time of the trigger inputs is set as 400  $\mu$ S.

## 2. JUMP (JP) Command:

JP value: Instructs device to jump directly to the voice group corresponding to the value indicated. The voice group value may range from 0 to 127 (direct jump).

JP R0: Instructs device to jump to whatever voice group is indicated by the value currently stored in register R0, from 0 to 255 (indirect jump).

## Conditional Instructions:

Conditional instructions are executed only when the conditions specified in the instructions hold. The conditional instructions are listed below. An explanation of the notation used in the instructions follows.

(Note: There are no conditional instructions for LD MODE.)

LD R0, VALUE @LAST: VALUE can be set from 0 to 255.  
 LD R0, VALUE @TGn\_STATUS: VALUE can be set from 0 to 255.  
 LD EN, OPERAND @LAST: EN - 4R, 3R, 2R, 1R, 4F, 3F, 2F, 1F.  
 LD STOP, OPERAND @LAST: STOP - X, X, X, X, X, STPC, STPB, STPA.  
 JP VALUE @LAST: VALUE can be set from 0 to 127.  
 JP R0 @LAST  
 JP VALUE @TGn\_STATUS: VALUE can be set from 0 to 127  
 JP R0 @TGn\_STATUS

## EXPLANATION:

@LAST: At last time of global repeat.

@TGn\_STATUS: When the status of the trigger specified (TGn) is in the condition specified, where the possible triggers and conditions are the following:

TG1\_HIGH  
 TG1\_LOW  
 TG2\_HIGH  
 TG2\_LOW  
 TG3\_HIGH  
 TG3\_LOW  
 TG4\_HIGH  
 TG4\_LOW

## End Instruction:

END: This command instructs the chip to cease all activity immediately.

## B. Program Structure Features and Execution Rules

1. There are eight hardware group entry points and 248 software group entry points, as follows:

		Group
8 H/W entries:	TG1F:	0
	TG2F:	1
	TG3F:	2
	TG4F:	3
	TG1R:	4

(Continued)

248 S/W entries:	TG2R:	5
	TG3R:	6
	TG4R:	7
		8
		9
		.
		.
		.
	POI:	32
		33
		.
		.
		.
		254
		255

2. Execution begins from group entry and is terminated by END instruction.
3. A H/W trigger interrupt stops the group currently being executed immediately and begins a new group.

## C. Mask Options

There are four mask options for the W528xxx family; the mask options are used to select features that cannot be programmed through the chip's registers.

The options are the following:

- LED flash type (synchronous/alternate)
- LED volume-controlled: No/Yes
- LED1 section-controlled: Yes/No
- LED2: section-controlled/STPC-controlled

## D. Speech Equation Description

The format of the speech equations for the W528xxx family is the same as that of the equations used in the Winbond W52160, W525XX, and W527XX series speech ICs. The following is an example of the speech equation format:

```
GR = N
H4+m1*SOUND1_FL+m2*SOUND2_FL+[1FFFF]+...+T4
END
```

where

GR = N defines the number of global repeats (from 1 to 16);  
 m1 and m2 define the number of local repeats (from 1 to 7);  
 SOUND1 and SOUND2 are the \*.WAM files of ADPCM converted voice data;  
 \_FL is the section control setting, for which the parameters F and L are as follows:  
 F: Voice output frequency setting:  
 0 = 4 KHz, 1 = 4.8 KHz, 2 = 6 KHz, 3 = 8 KHz;  
 L: LED output setting:  
 1: ON  
 0: OFF; and  
 [1FFFF] is a period of silence of length 1FFFF;  
 H4, T4: Represent head and tail ADPCM files, respectively.

## E. Programmable Power-on Initialization

Whenever the W528xxx is powered on, the program contained in the 32nd voice group will be executed after the power-on delay (about 160 mS), so the user can write a program into this group to set the power-on initial state. If the user does not wish to execute a program at power-on, an "END" instruction should be entered in group 32. The W528xxx power-on initialization process can be interrupted by trigger inputs.

## F. Programming Examples

This section presents several examples of how the functions of the W528xxx may be programmed. Customer programs should be written in ASCII code using a text editor; after compiling, the sound effects resulting from the programs can be tested using a Winbond demo board.

EXAMPLE1: Four playing mode settings:

a. One-Shot Trigger Mode

0: LD EN, 0x01 ; Enable TG1 falling edge input only.  
 H4 + sound1 + T4  
 END

The timing diagram for this example is shown below:

- b. Level-Hold Trigger Mode
- 0: LD EN, 0x11 ; Enable TG1 rising/falling edge input.  
H4 + sound1 + T4  
JP 0 ; Repeat sound1 until TG1 key released.
- 4: END ; As soon as TG1 key is released, execute this group entry.

The timing diagram is shown below:

- c. Complete-Cycle Level Hold
- 0: LD EN, 0x01 ; Enable TG1 falling edge only.  
H4 + sound1 + T4  
JP 0 @TG1\_LOW ; If TG1 status is low level voltage (trigger is pressed), then jump to 0;  
if not, execute next instruction (END).
- END

The timing diagram is shown below:

- d. Single-Cycle Level Hold
- 0: LD EN, 0x11 ; Enable both falling and rising edge input of TG1.  
H4 + sound1 + T4  
END  
.  
.  
.
- 4: END ; As soon as TG1 is key released, execute this group entry.

case 1:

TG1:

AUD:

case 2:

TG1:

AUD:

END

The diagram shows two digital signals over time. The top signal, labeled 'TG1:', is a square wave that starts high, drops to low, returns to high, drops to low, returns to high, and then stays high for the remainder of the sequence. The bottom signal, labeled 'AUD:', starts low, rises to high, and remains high until it drops to low. This high period is divided into two segments, each labeled 'Sound 1'. The first 'Sound 1' segment is preceded by two vertical lines, each labeled 'Restart' below it. The second 'Sound 1' segment is preceded by a single vertical line. The signal returns to low after the second 'Sound 1' segment.

END

The diagram shows two signals over time. The top signal, labeled 'TG1', is a high-frequency square wave. The bottom signal, labeled 'AUD', is a low-frequency signal that is high for two distinct periods, each labeled 'Sound 1'. The first 'Sound 1' pulse occurs during the first two high-frequency cycles of TG1. The second 'Sound 1' pulse occurs during the sixth and seventh high-frequency cycles of TG1.

## ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	CONDITIONS	RATED VALUE	UNIT
Power Supply	VDD-VSS	-	-0.3 to +7.0	V
Input Voltage	VIN	All Inputs	VSS -0.3 to VDD +0.3	V
Storage Temp.	TSTG	-	-55 to +150	°C
Operating Temp.	TOPR	-	0 to +70	°C

Note: Exposure to conditions beyond those listed under Absolute Maximum Ratings may adversely affect the life and reliability of the device.

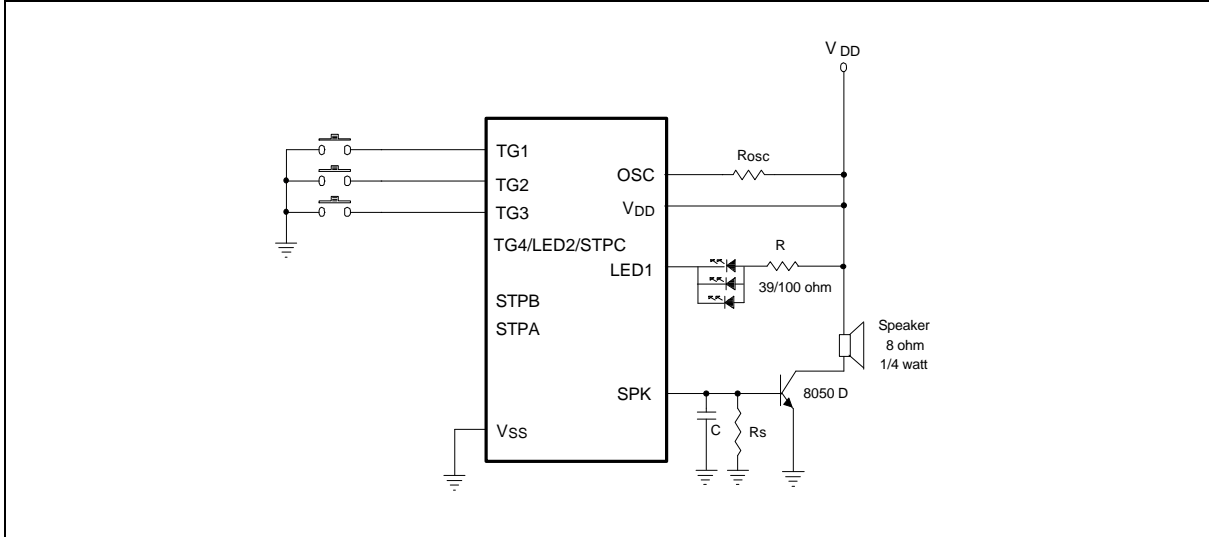

## ELECTRICAL CHARACTERISTICS

(TA = 25° C, VSS = 0 V)

PARAMETER		SYM.	CONDITIONS	LIMITS			UNIT
				MIN.	TYP.	MAX.	
Operating Voltage		VDD	-	2.4	3	5.5	V
Input Voltage		VIL	All Input Pins	VSS -0.3	-	0.3 VDD	V
		VIH		0.7 VDD	-	VDD	
Standby Current		IDD1	VDD = 3V, No Playing	-	-	0.2	μA
		IDD2	VDD = 5V, No Playing	-	-	0.4	
Operating Current		IOP1	VDD = 3V, No Load	-	-	400	μA
		IOP2	VDD = 5V, No Load	-	-	800	
Input Current for TG1-TG4		IIN	VDD = 3V, VIN = 0V	-	-	-6	μA
SPK (D/A Full Scale)		IO1	VDD = 4.5V, RL = 100 Ω	-4.0	-5.0	-6.0	mA
Output Current of STPC		IO1	VDD = 3V, VOUT = 0.4V	1	-	-	mA
		IOH	VDD = 3V, VOUT = 2.7V	-0.5	-	-	
Output Current	LED1	IO	VDD = 3V, VOUT = 1V	10	-	-	mA
	LED2		VDD = 4.5V, VOUT = 1V	15	-	-	
	STPA	IO1	VDD = 3V, VOUT = 0.4V	1	3	-	
	STPB	IOH	VDD = 3V, VOUT = 2.7V	-1	-3	-	
Oscillation Freq.		FOSC	VDD = 3V, ROSC = Typ.	2.7	3	3.3	MHz
			VDD = 4.5V, ROSC = Typ.	2.7	3	3.3	
Oscillation Freq. Deviation by Voltage Drop		$\frac{\Delta F_{OSC}}{F_{OSC}}$	$\frac{F(3V) - F(2.4V)}{F(3V)}$	0	4	7.5	%
Input Debounce Time		TDEB1	FOSC = 3 MHz, SR = 6 KHz	50	-	-	mS
		TDEB2		400	-	-	μS

Note: ROSC = 430K Ohm for all bodies in W528xxx besides W5280 (ROSC = 1.2M ohm).

## TYPICAL APPLICATION CIRCUIT

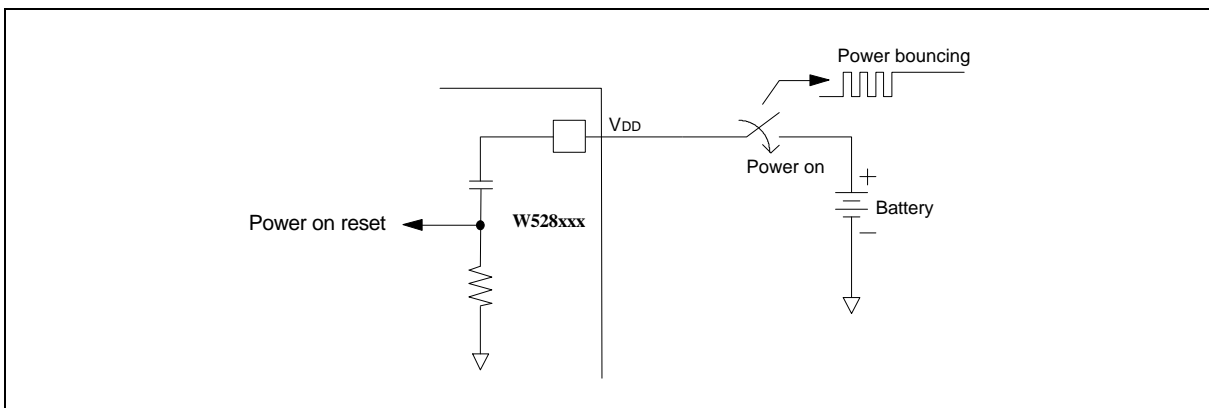

### Notes:

1. In principle, the playing speed determined by Rsc should correspond to the sampling rate during the coding phase. The playing speed may be adjusted by varying Rsc, however.
2. Rs is an optional current-dividing resistor. If Rs is added, the resistance should be between 470 and 750Ω.
3. Cs is optional.
4. The DC current gain  $\beta$  of transistor 8050 ranges from 120 to 200.
5. All unused trigger pins can be left open because of their internal pull-high resistance.
6. R is used to limit the current on the LED. Case 1:  $V_{DD} = 3V$ ,  $R = 39\Omega$  for 1/2/3 LEDs.  
Case 2:  $V_{DD} = 4.5V$ ,  $R = 39\Omega$  for 2/3 LEDs and  $R = 100\Omega$  for 1 LED.
7. No warranty for production.

## SUPPLEMENT

### A. Power Bouncing

If an irregularity (such as bouncing) occurs in the power supply to VDD, as shown in the diagram, the W528xxx may hang or the logic state machine may lock up. To return the chip to normal operation, short VDD and VSS for the W528xxx and then release again.

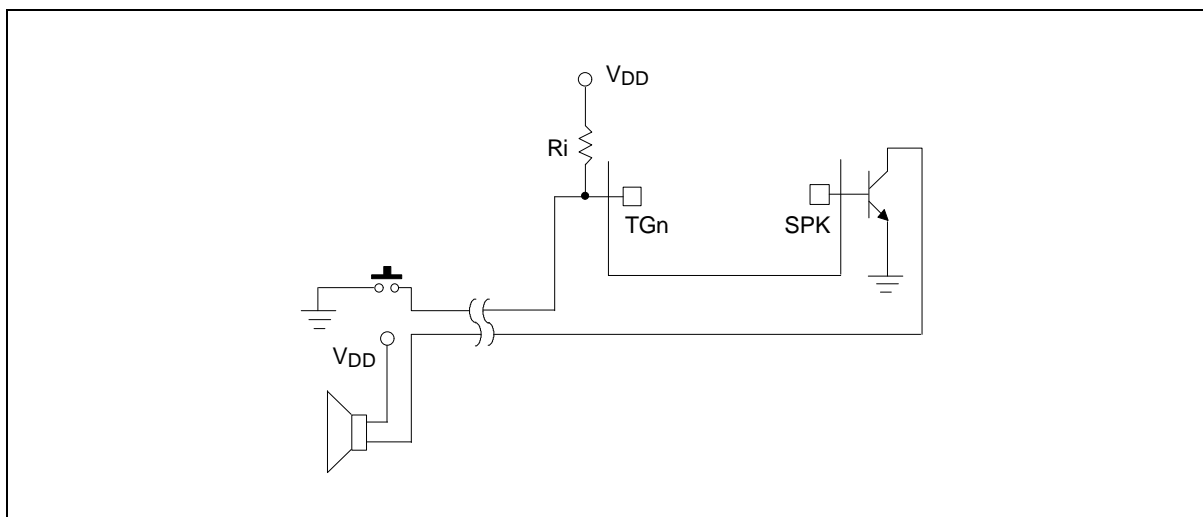

## B. Trigger Pin Coupling Effect

The trigger pins (TG1–TG4) are built-in 500 K $\Omega$  pull high resistor.

If the wire of the input trigger is very close to the speaker wire in the application environment, the coupling effect will occur. The input voltage of the trigger pin will be unstable, causing the trigger operation to become abnormal.

An external pull high resistor ( $R_i$ ) connecting the trigger pin and  $V_{DD}$  can resolve this problem. The value of the  $R_i$  depends on your application environment.
