**Data Sheet** 

Document Number: MSC7119 Rev. 6, 7/2007

# **MSC7119**

# Low-Cost 16-bit DSP with DDR Controller and 10/100 Mbps Ethernet MAC

- StarCore<sup>®</sup> SC1400 DSP extended core with one SC1400 DSP core, 256 Kbyte of internal SRAM M1 memory, 16 way 16 Kbyte instruction cache (ICache), four-entry write buffer, programmable interrupt controller (PIC), and low-power Wait and Stop processing modes.
- 192 Kbyte M2 memory for critical data and temporary data buffering.
- 8 Kbyte boot ROM.
- AHB-Lite crossbar switch that allows parallel data transfers
  between four master ports and six slave ports, where each port
  connects to an AHB-Lite bus; fixed or round robin priority
  programmable at each slave port; programmable bus parking at
  each slave port; low power mode.
- Internal PLL generates up to 300 MHz clock for the SC1400 core and up to 150 MHz for the crossbar switch, DMA channels, M2 memory, and other peripherals.
- Clock synthesis module provides predivision of PLL input clock; independent clocking of the internal timers and DDR module; programmable operation in the SC1400 low power Stop mode; independent shutdown of different regions of the device.
- Enhanced 16-bit wide host interface (HDI16) provides a glueless connection to industry-standard microcomputers, microprocessors, and DSPs and can also operate with an 8-bit host data bus, making if fully compatible with the DSP56300 HI08 from the external host side.
- DDR memory controller that supports byte enables for up to a 32-bit data bus; glueless interface to 150 MHz 14-bit page mode DDR-RAM; 14-bit external address bus supporting up to 1 Gbyte; and 16-bit or 32-bit external data bus.
- Programmable memory interface with independent read buffers, programmable predictive read feature for each buffer, and a write buffer.
- System control unit performs software watchdog timer function; includes programmable bus time-out monitors on AHB-Lite slave buses; includes bus error detection and programmable time-out monitors on AHB-Lite master buses; and has address out-of-range detection on each crossbar switch buses.
- Event port collects and counts important signal events including DMA and interrupt requests and trigger events such as interrupts, breakpoints, DMA transfers, or wake-up events; units operate independently, in sequence, or triggered externally; can be used standalone or with the OCE10.

- Multi-channel DMA controller with 32 time-multiplexed unidirectional channels, priority-based time-multiplexing between channels using 32 internal priority levels, fixed- or round-robin-priority operation, major-minor loop structure, and DONE or DRACK protocol from requesting units.
- Two independent TDM modules with independent receive and transmit, programmable sharing of frame sync and clock, programmable word size (8 or 16-bit), hardware-base A-law/μ-law conversion, up to 50 Mbps data rate per TDM, up to 128 channels, with glueless interface to E1/T1 frames and MVIP, SCAS, and H.110 buses.
- Ethernet controller with support for 10/100 Mbps MII/RMII designed to comply with IEEE Std. 802.3<sup>TM</sup>, 802.3u<sup>TM</sup>, 802.3u<sup>TM</sup>, and 802.3ac<sup>TM</sup>; with internal receive and transmit FIFOs and a FIFO controller; direct access to internal memories via its own DMA controller; full and half duplex operation; programmable maximum frame length; virtual local area network (VLAN) tag and priority support; retransmission of transmit FIFO following collision; CRC generation and verification for inbound and outbound packets; and address recognition including promiscuous, broadcast, individual address. hash/exact match, and multicast hash match.
- UART with full-duplex operation up to 5.0 Mbps.
- Up to 41 general-purpose input/output (GPIO) ports.
- I<sup>2</sup>C interface that allows booting from EEPROM devices up to 1 Mbyte.
- Two quad timer modules, each with sixteen configurable 16-bit timers
- fieldBIST<sup>TM</sup> unit detects and provides visibility into unlikely field
  failures for systems with high availability to ensure structural
  integrity, that the device operates at the rated speed, is free from
  reliability defects, and reports diagnostics for partial or complete
  device inoperability.
- Standard JTAG interface allows easy integration to system firmware and internal on-chip emulation (OCE10) module.
- Optional booting external host via 8-bit or 16-bit access through the HDI16, 1<sup>2</sup>C, or SPI using in the boot ROM to access serial SPI Flash/EEPROM devices; different clocking options during boot with the PLL on or off using a variety of input frequency ranges.

Figure 1. MSC7119 Block Diagram

# 1 Pin Assignments

This section includes diagrams of the MSC7119 package ball grid array layouts and pinout allocation tables.

# 1.1 FC-PBGA Ball Layout Diagrams

Top and bottom views of the MAP-BGA package are shown in Figure 2 and Figure 3 with their ball location index numbers.

Figure 2. MSC7119 Molded Array Process-Ball Grid Array (MAP-BGA), Top View

Figure 3. MSC7119 Molded Array Process-Ball Grid Array (MAP-BGA), Bottom View

# 1.2 Signal List By Ball Location

**Table 1** lists the signals sorted by ball number and configuration.

Table 1. MSC7119 Signals by Ball Designator

|        | Signal Names |                          |                      |               |          |            |  |  |  |

# 2 Electrical Characteristics

This document contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications. For additional information, see the *MSC711x Reference Manual*.

# 2.1 Maximum Ratings

### **CAUTION**

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, normal precautions should be taken to avoid exceeding maximum voltage ratings. Reliability is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or  $V_{DD}$ ).

In calculating timing requirements, adding a maximum value of one specification to a minimum value of another specification does not yield a reasonable sum. A maximum specification is calculated using a worst case variation of process parameter values in one direction. The minimum specification is calculated using the worst case for the same parameters in the opposite direction. Therefore, a "maximum" value for a specification never occurs in the same device with a "minimum" value for another specification; adding a maximum to a minimum represents a condition that can never exist.

#### **Electrical Characteristics**

**Table 2** describes the maximum electrical ratings for the MSC7119.

**Table 2. Absolute Maximum Ratings** 

| Rating                        | Symbol             | Value              | Unit |
|-------------------------------|--------------------|--------------------|------|
| Core supply voltage           | V <sub>DDC</sub>   | 1.5                | V    |
| Memory supply voltage         | $V_{DDM}$          | 4.0                | V    |
| PLL supply voltage            | V <sub>DDPLL</sub> | 1.5                | V    |
| I/O supply voltage            | V <sub>DDIO</sub>  | -0.2 to 4.0        | V    |
| Input voltage                 | V <sub>IN</sub>    | (GND – 0.2) to 4.0 | V    |
| Reference voltage             | V <sub>REF</sub>   | 4.0                | V    |
| Maximum operating temperature | TJ                 | 105                | °C   |
| Minimum operating temperature | T <sub>A</sub>     | -40                | °C   |
| Storage temperature range     | T <sub>STG</sub>   | -55 to +150        | °C   |

Notes:

- 1. Functional operating conditions are given in Table 3.
- 2. Absolute maximum ratings are stress ratings only, and functional operation at the maximum is not guaranteed. Stress beyond the listed limits may affect device reliability or cause permanent damage.
- 3. Section 3.1, Thermal Design Considerations includes a formula for computing the chip junction temperature (T<sub>J</sub>).

# 2.2 Recommended Operating Conditions

Table 3 lists recommended operating conditions. Proper device operation outside of these conditions is not guaranteed.

**Table 3. Recommended Operating Conditions** 

| Rating                      | Symbol                           | Value                        | Unit                                   |
|-----------------------------|----------------------------------|------------------------------|--|
| Core supply voltage         | V <sub>DDC</sub>                 | 1.14 to 1.26                 | V                                      |

### 2.3 Thermal Characteristics

Table 4 describes thermal characteristics of the MSC7119 for the MAP-BGA package.

**Table 4. Thermal Characteristics for MAP-BGA Package** 

|   |                | MAP-BGA               |                               |      |  |
|---|----------------|-----------------------|-------------------------------|------|--|
| Characteristic  | Symbol         | Natural<br>Convection | 200 ft/min<br>(1 m/s) airflow | Unit |  |
| Junction-to-ambient <sup>1, 2</sup>                   | $R_{	heta JA}$ | 39                    | 31                            | °C/W |  |
| Junction-to-ambient, four-layer board <sup>1, 3</sup> | $R_{	heta JA}$ | 23                    | 20                            | °C/W |  |
| Junction-to-board <sup>4</sup>                        | $R_{	heta JB}$ | 12                    |                               | °C/W |  |
| Junction-to-case <sup>5</sup>                         | $R_{	heta JC}$ | 7                     |                               | °C/W |  |
| Junction-to-package-top <sup>6</sup>                  | $\Psi_{JT}$    | 2                     |                               | °C/W |  |

Notes:

- Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
- 2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
- 3. Per JEDEC JESD51-6 with the board horizontal.
- 4. Thermal resistance between the die and the printed circuit board per JEDEC JESD 51-8. Board temperature is measured on the top surface of the board near the package.
- 5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
- **6.** Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

Section 3.1, Thermal Design Considerations explains these characteristics in detail.

### 2.4 DC Electrical Characteristics

This section describes the DC electrical characteristics for the MSC7119.

**Note:** The leakage current is measured for nominal voltage values must vary in the same direction (for example, both  $V_{DDIO}$  and  $V_{DDC}$  vary by +2 percent or both vary by -2 percent).

**Table 5. DC Electrical Characteristics** 

| Characteristic   | Symbol                                 | Min                     | Typical   | Max                     | Unit |
|--|--|-------------------------|-----------|-------------------------|------|
| Core and PLL voltage                                       | V <sub>DDC</sub><br>V <sub>DDPLL</sub> | 1.14                    | 1.2       | 1.26                    | V    |
| DRAM interface I/O voltage <sup>1</sup>                    | $V_{DDM}$                              | 2.375                   | 2.5       | 2.625                   | V    |
| I/O voltage  | V <sub>DDIO</sub>                      | 3.135                   | 3.3       | 3.465                   | V    |
| DRAM interface I/O reference voltage <sup>2</sup>          | V <sub>REF</sub>                       | $0.49 \times V_{DDM}$   | 1.25      | $0.51 \times V_{DDM}$   | V    |
| DRAM interface I/O termination voltage <sup>3</sup>        | VTT                                    | V <sub>REF</sub> - 0.04 | $V_{REF}$ | V <sub>REF</sub> + 0.04 | V    |
| Input high CLKIN voltage                                   | V <sub>IHCLK</sub>                     | 2.4                     | 3.0       | 3.465                   | V    |
| DRAM interface input high I/O voltage                      | V <sub>IHM</sub>                       | V <sub>REF</sub> + 0.28 | $V_{DDM}$ | V <sub>DDM</sub> + 0.3  | V    |
| DRAM interface input low I/O voltage                       | V <sub>ILM</sub>                       | -0.3                    | GND       | V <sub>REF</sub> – 0.18 | V    |
| Input leakage current, V <sub>IN</sub> = V <sub>DDIO</sub> | I <sub>IN</sub>                        | -1.0                    | 0.09      | 1                       | μA   |
| V <sub>REF</sub> input leakage current                     | I <sub>VREF</sub>                      | _                       | _         | 5                       | μA   |

#### **Electrical Characteristics**

Table 5. DC Electrical Characteristics (continued)

| Characteristic  | Symbol          | Min  | Typical | Max | Unit |
|---|-----------------|------|---------|-----|------|
| Tri-state (high impedance off state) leakage current, $V_{IN} = V_{DDIO}$ | I <sub>OZ</sub> | -1.0 | 0.09    | 1   | μА   |
| Signal low input current, V <sub>IL</sub> = 0.4 V                         | ΙL              | -1.0 | 0.09    | 1   | μΑ   |
| Signal high input current, V <sub>IH</sub> = 2.0 V                        | I <sub>H</sub>  | -1.0 | 0.09    | 1   | μΑ   |
| Output high voltage, $I_{OH} = -2$ mA, except open drain pins             | $V_{OH}$        | 2.0  | 3.0     | _   | V    |
| Output low voltage, I <sub>OL</sub> = 5 mA                                | V <sub>OL</sub> | _    | 0       | 0.4 | V    |
| Typical power at 300 MHz <sup>5</sup>                                     | Р               | _    | 324.0   | _   | mW   |

Notes:

- The value of V<sub>DDM</sub> at the MSC7119 device must remain within 50 mV of V<sub>DDM</sub> at the DRAM device at all times.
- V<sub>REF</sub> must be equal to 50% of V<sub>DDM</sub> and track V<sub>DDM</sub> variations as measured at the receiver. Peak-to-peak noise must not exceed ±2% of the DC value.
- V<sub>TT</sub> is not applied directly to the MSC7119 device. It is the level measured at the far end signal termination. It should be equal to  $V_{\text{REF}}$ . This rail should track variations in the DC level of  $V_{\text{REF}}$ .
- Output leakage for the memory interface is measured with all outputs disabled,  $0 \text{ V} \le \text{V}_{\text{OUT}} \le \text{V}_{\text{DDM}}$ .
- The core power values were measured.using a standard EFR pattern at typical conditions (25°C, 300 MHz, 1.2 V core).

#### **Table 6** lists the DDR DRAM capacitance.

### **Table 6. DDR DRAM Capacitance**

| Parameter/Condition                     | Symbol           | Max | Unit |
|---|------------------|-----|------|
| Input/output capacitance: DQ, DQS       | C <sub>IO</sub>  | 30  | pF   |
| Delta input/output capacitance: DQ, DQS | C <sub>DIO</sub> | 30  | pF   |

These values were measured under the following conditions:

- $V_{DDM} = 2.5 V \pm 0.125 V$
- f = 1 MHz
- T<sub>A</sub> = 25°C
- $V_{OUT} = V_{DDM}/2$
- V<sub>OUT</sub> (peak to peak) = 0.2 V

# 2.5 AC Timings

This section presents timing diagrams and specifications for individual signals and parallel I/O outputs and inputs. All AC timings are based on a 30 pF load, except where noted otherwise, and a 50  $\Omega$  transmission line. For any additional pF, use the following equations to compute the delay:

Standard interface: 2.45 + (0.054 × C<sub>load</sub>) ns
 DDR interface: 1.6 + (0.002 × C<sub>load</sub>) ns

### 2.5.1 Clock and Timing Signals

The following tables describe clock signal characteristics. **Table 6** shows the maximum frequency values for internal (core, reference, and peripherals) and external (CLKO) clocks. You must ensure that maximum frequency values are not exceeded (see **Section 2.5.2** for the allowable ranges when using the PLL).

**Table 6. Maximum Frequencies** 

| Characteristic                         | Maximum in MHz |
|--|----------------|
| Core clock frequency (CLOCK)           | 300            |
| External output clock frequency (CLKO) | 75             |
| Memory clock frequency (CK, CK)        | 150            |
| TDM clock frequency (TxRCK, TxTCK)     | 50             |

Table 7. Clock Frequencies in MHz

| Characteristic   | Symbol             | Min | Max |
|--|--------------------|-----|-----|
| CLKIN frequency  | F <sub>CLKIN</sub> | 10  | 100 |
| CLOCK frequency  | F <sub>CORE</sub>  | _   | 300 |
| CK, CK frequency   | F <sub>CK</sub>    | _   | 150 |
| TDMxRCK, TDMxTCK frequency   | F <sub>TDMCK</sub> |     | 50  |
| CLKO frequency   | F <sub>CKO</sub>   | _   | 75  |
| AHB/IPBus/APB clock frequency  | F <sub>BCK</sub>   |     | 150 |
| Note: The rise and fall time of external clocks should be 5 ns maximum |                    |     |     |

**Table 8. System Clock Parameters** 

| Characteristic                        | Min | Max  | Unit |
|---------------------------------------|-----|------|------|
| CLKIN frequency                       | 10  | 100  | MHz  |
| CLKIN slope                           | _   | 5    | ns   |
| CLKIN frequency jitter (peak-to-peak) | _   | 1000 | ps   |
| CLKO frequency jitter (peak-to-peak)  | _   | 150  | ps   |

### 2.5.2 Configuring Clock Frequencies

This section describes important requirements for configuring clock frequencies in the MSC7119 device when using the PLL block. To configure the device clocking, you must program four fields in the Clock Control Register (CLKCTL):

- *PLLDVF field*. Specifies the PLL division factor (PLLDVF + 1) to divide the input clock frequency F<sub>CLKIN</sub>. The output of the divider block is the input to the multiplier block.
- *PLLMLTF field.* Specifies the PLL multiplication factor (PLLMLTF + 1). The output from the multiplier block is the loop frequency F<sub>LOOP</sub>.
- RNG field. Selects the available PLL frequency range for F<sub>VCO</sub>, either F<sub>LOOP</sub> when the RNG bit is set (1) or F<sub>LOOP</sub>/2 when the RNG bit is cleared (0).
- CKSEL field. Selects  $F_{CLKIN}$ ,  $F_{VCO}$ , or  $F_{VCO}/2$  as the source for the core clock.

There are restrictions on the frequency range permitted at the beginning of the multiplication portion of the PLL that affect the allowable values for the PLLDVF and PLLMLTF fields. The following sections define these restrictions and provide guidelines to configure the device clocking when using the PLL. Refer to the Clock and Power Management chapter in the MSC711x Reference Manual for details on the clock programming model.

### 2.5.2.1 PLL Multiplier Restrictions

There are two restrictions for correct usage of the PLL block:

- The input frequency to the PLL multiplier block (that is, the output of the divider) must be in the range 10–25 MHz.
- The output frequency of the PLL multiplier must be in the range 266–532 MHz.

When programming the PLL for a desired output frequency using the PLLDVF, PLLMLTF, and RNG fields, you must meet these constraints.

### 2.5.2.2 Input Division Factors and Corresponding CLKIN Frequency Range

The value of the PLLDVF field determines the allowable CLKIN frequency range, as shown in Table 9.

**PLLDVF** Input Divide **CLKIN Frequency Range** Comments **Field Value Factor** 0x00 1 10 to 25 MHz Input Division by 1 0x01 2 20 to 50 MHz Input Division by 2 3 30 to 75 MHz Input Division by 3 0x020x03 4 40 to 100 MHz Input Division by 4 5 50 to 100 MHz Input Division by 5 0x040x05 6 60 to 100 MHz Input Division by 6 70 to 100 MHz 0x06 7 Input Division by 7 80 to 100 MHz 0x07 8 Input Division by 8 0x08 9 90 to 100 MHz Input Division by 9 0x09 10 100 MHz Input Division by 10 The maximum CLKIN frequency is 100 MHz. Therefore, the PLLDVF value must be in the range from 1-10. Note:

Table 9. CLKIN Frequency Ranges by Divide Factor Value

MSC7119 10/100 Mbps Ethernet MAC Data Sheet, Rev. 6

#### 2.5.2.3 **Multiplication Factor Range**

The multiplier block output frequency ranges depend on the divided input clock frequency as shown in Table 10.

**Table 10. PLLMLTF Ranges** 

|       | Multiplier Block (Loop) Output Range  | Minimum PLLMLTF Value   | Maximum PLLMLTF Value   |
|-------|---|-------------------------|-------------------------|
|       | 266 ≤ [Divided Input Clock × (PLLMLTF + 1)] ≤ 532 MHz   | 266/Divided Input Clock | 532/Divided Input Clock |
| Note: | Note: This table results from the allowed range for F <sub>Loop</sub> . The minimum and maximum multiplication factors are dependent on the frequency of the Divided Input Clock. |                         |                         |

#### 2.5.2.4 Allowed Core Clock Frequency Range

The frequency delivered to the core, extended core, and peripherals depends on the value of the CLKCTRL[RNG] bit as shown in Table 11.

Table 11. F<sub>vco</sub> Frequency Ranges

| CLI   | KCTRL[RNG] Value  | Allowed Range of F <sub>vco</sub> |
|-------|---|-----------------------------------|
|       | 1   | 266 ≤ F <sub>vco</sub> ≤ 532 MHz  |
|       | 0   | 133 ≤ F <sub>vco</sub> ≤ 266 MHz  |
| Note: | This table results from the allowed range for F <sub>vco</sub> , which is F <sub>Loop</sub> modified by CLKCTRL[RNG]. |                                   |

This bit along with the CKSEL determines the frequency range of the core clock.

**Table 12. Resulting Ranges Permitted for the Core Clock** 

| CLKCTRL[CKSEL]        | CLKCTRL[RNG] | Resulting<br>Division<br>Factor | Allowed Range<br>of Core Clock | Comments                          |  |  |  |
|-----------------------|--------------|---------------------------------|--------------------------------|-----------------------------------|--|--|--|
| 11                    | 1            | 1                               | 266 ≤ core clock ≤ 300 MHz     | Limited by maximum core frequency |  |  |  |
| 11                    | 0            | 2                               | 133 ≤ core clock ≤ 266 MHz     | Limited by range of PLL           |  |  |  |
| 01                    | 1            | 2                               | 133 ≤ core clock ≤ 266 MHz     | Limited by range of PLL           |  |  |  |
| 01                    | 0            | 4                               | 66.5 ≤ core clock ≤ 133 MHz    | Limited by range of PLL           |  |  |  |
| Note: This table resu |              |                                 |                                |                                   |  |  |  |

#### 2.5.2.5 **Core Clock Frequency Range When Using DDR Memory**

The core clock can also be limited by the frequency range of the DDR devices in the system. Table 13 summarizes this restriction.

Table 13. Core Clock Ranges When Using DDR

| DDR Type          | Allowed Frequency<br>Range for DDR CK | Corresponding Range for the Core Clock | Comments                                  |
|-------------------|---------------------------------------|--|---|
| DDR 200 (PC-1600) | 83–100 MHz                            | 166 ≤ core clock ≤ 200 MHz             | Core limited to 2 × maximum DDR frequency |
| DDR 266 (PC-2100) | 83–133 MHz                            | 166 ≤ core clock ≤ 266 MHz             | Core limited to 2 × maximum DDR frequency |
| DDR 333 (PC-2600) | 83–150 MHz                            | 166 ≤ core clock ≤ 300 MHz             | Core limited to 2 × maximum DDR frequency |

MSC7119 10/100 Mbps Ethernet MAC Data Sheet, Rev. 6 Freescale Semiconductor 23

# 2.5.3 Reset Timing

The MSC7119 device has several inputs to the reset logic. All MSC7119 reset sources are fed into the reset controller, which takes different actions depending on the source of the reset. The reset status register indicates the most recent sources to cause a reset. **Table 14** describes the reset sources.

**Table 14. Reset Sources** 

| Name                                       | Direction     | Description  |
|--|---------------|--|
| Power-on reset<br>(PORESET)                | Input         | Initiates the power-on reset flow that resets the MSC7119 and configures various attributes of the MSC7119. On PORESET, the entire MSC7119 device is reset. SPLL and DLL states are reset, HRESET is driven, the SC1400 extended core is reset, and system configuration is sampled. The system is configured only when PORESET is asserted. |
| External Hard reset (HRESET)               | Input/ Output | Initiates the hard reset flow that configures various attributes of the MSC7119. While HRESET is asserted, HRESET is an open-drain output. Upon hard reset, HRESET is driven and the SC1400 extended core is reset.  |
| Software watchdog reset                    | Internal      | When the MSC7119 watchdog count reaches zero, a software watchdog reset is signalled. The enabled software watchdog event then generates an internal hard reset sequence.  |
| Bus monitor reset                          | Internal      | When the MSC7119 bus monitor count reaches zero, a bus monitor hard reset is asserted. The enabled bus monitor event then generates an internal hard reset sequence.   |
| JTAG EXTEST,<br>CLAMP, or<br>HIGHZ command | Internal      | When a Test Access Port (TAP) executes an EXTEST, CLAMP, or HIGHZ command, the TAP logic asserts an internal reset signal that generates an internal soft reset sequence.  |

**Table 15** summarizes the reset actions that occur as a result of the different reset sources.

**Table 15. Reset Actions for Each Reset Source** 

|   | Power-On Reset<br>(PORESET) | H <u>ard Rese</u> t<br>(HRESET)                                  | S <u>oft Rese</u> t<br>(SRESET)             |
|---|-----------------------------|--|---|
| Reset Action/Reset Source   | External only               | External or<br>Internal (Software<br>Watchdog or Bus<br>Monitor) | JTAG Command:<br>EXTEST, CLAMP,<br>or HIGHZ |
| Configuration pins sampled (refer to <b>Section 2.5.3.1</b> for details). | Yes                         | No   | No  |
| PLL and clock synthesis states Reset                                      | Yes                         | No   | No  |
| HRESET Driven   | Yes                         | Yes  | No  |

# 2.5.3.1 Power-On Reset (PORESET) Pin

Asserting  $\overline{\text{PORESET}}$  initiates the power-on reset flow.  $\overline{\text{PORESET}}$  must be asserted externally for at least 16 CLKIN cycles after external power to the MSC7119 reaches at least 2/3 V<sub>DD</sub>.

25

# 2.5.3.2 Reset Configuration

The MSC7119 has two mechanisms for writing the reset configuration:

- From a host through the host interface (HDI16)
- From memory through the I<sup>2</sup>C interface

Five signal levels (see **Chapter 1** for signal description details) are sampled on PORESET deassertion to define the boot and operating conditions:

- BM[0–1]
- SWTE
- H8BIT
- HDSP

### 2.5.3.3 Reset Timing Tables

Table 16 and Figure 4 describe the reset timing for a reset configuration write.

Table 16. Timing for a Reset Configuration Write

| No.   | Characteristics                                       | Expression             | Unit   |
|-------|---|------------------------|--------|
| 1     | Required external PORESET duration minimum            | 16/F <sub>CLKIN</sub>  | clocks |
| 2     | Delay from PORESET deassertion to HRESET deassertion  | 521/F <sub>CLKIN</sub> | clocks |
| Note: | Timings are not tested, but are guaranteed by design. |                        |        |

Figure 4. Timing Diagram for a Reset Configuration Write

### 2.5.4 DDR DRAM Controller Timing

This section provides the AC electrical characteristics for the DDR DRAM interface.

### 2.5.4.1 DDR DRAM Input AC Timing Specifications

Table 17 provides the input AC timing specifications for the DDR DRAM interface.

**Table 17. DDR DRAM Input AC Timing** 

| No. | Parameter  | Symbol          | Min                     | Max                     | Unit |
|-----|--|-----------------|-------------------------|-------------------------|------|
| _   | AC input low voltage                               | V <sub>IL</sub> | _                       | V <sub>REF</sub> - 0.31 | V    |
| _   | AC input high voltage                              | V <sub>IH</sub> | V <sub>REF</sub> + 0.31 | V <sub>DDM</sub> + 0.3  | V    |
| 201 | Maximum Dn input setup skew relative to DQSn input | _               | _                       | 900                     | ps   |
| 202 | Maximum Dn input hold skew relative to DQSn input  | _               | _                       | 900                     | ps   |

**Notes:** 1. Maximum possible skew between a data strobe (DQSn) and any corresponding bit of data (D[8n +  $\{0...7\}$ ] if  $0 \le n \le 7$ ).

2. See Table 18 for t<sub>CK</sub> value.

3. Dn should be driven at the same time as DQSn. This is necessary because the DQSn centering on the DQn data tenure is done internally.

Figure 5. DDR DRAM Input Timing Diagram

### 2.5.4.2 DDR DRAM Output AC Timing Specifications

**Table 18** and **Table 19** list the output AC timing specifications and measurement conditions for the DDR DRAM interface.

**Table 18. DDR DRAM Output AC Timing** 

| No. | Parameter  | Symbol              | Min                          | Max    | Unit     |
|-----|--|---------------------|------------------------------|--------|----------|
| 200 | CK cycle time, (CK/CK crossing) <sup>1</sup> • 100 MHz (DDR200) • 150 MHz (DDR300) | t <sub>CK</sub>     | 10<br>6.67                   | _<br>_ | ns<br>ns |
| 204 | An/RAS/CAS/WE/CKE output setup with respect to CK                                  | t <sub>DDKHAS</sub> | 0.5 × t <sub>CK</sub> – 1000 | _      | ps       |
| 205 | An/RAS/CAS/WE/CKE output hold with respect to CK                                   | t <sub>DDKHAX</sub> | 0.5 × t <sub>CK</sub> – 1000 | _      | ps       |

| 210 | Dn/DQMn output hold with respect to DQSn <sup>3</sup>  | t <sub>DDKHDX</sub> ,<br>t <sub>DDKLDX</sub> | 0.25 × t <sub>CK</sub> – 750 | _   | ps   |
| 211 | DQSn preamble start <sup>4</sup>                       | t <sub>DDKHMP</sub>                          | $-0.25 \times t_{CK}$        | _   | ps   |
| 212 | DQSn epilogue end <sup>5</sup>                         | t <sub>DDKHME</sub>                          | -600                         | 600 | ps   |

Notes:

- 1. All CK/CK referenced measurements are made from the crossing of the two signals ±0.1 V.
- 2. t<sub>DDKHMH</sub> can be modified through the TCFG2[WRDD] DQSS override bits. The DRAM requires that the first write data strobe arrives 75–125% of a DRAM cycle after the write command is issued. Any skew between DQSn and CK must be considered when trying to achieve this 75%–125% goal. The TCFG2[WRDD] bits can be used to shift DQSn by 1/4 DRAM cycle increments. The skew in this case refers to an internal skew existing at the signal connections. By default, the CK/CK crossing occurs in the middle of the control signal (An/RAS/CAS/WE/CKE) tenure. Setting TCFG2[ACSM] bit shifts the control signal assertion 1/2 DRAM cycle earlier than the default timing. This means that the signal is asserted no earlier than 600 ps before the CK/CK crossing and no later than 600 ps after the crossing time; the device uses 1200 ps of the skew budget (the interval from –600 to +600 ps). Timing is verified by referencing the falling edge of CK. See Chapter 10 of the MSC711x Reference Manual for details.
- 3. Determined by maximum possible skew between a data strobe (DQS) and any corresponding bit of data. The data strobe should be centered inside of the data eye.
- 4. Please note that this spec is in reference to the DQSn first rising edge. It could also be referenced from CK(r), but due to programmable delay of the write strobes (TCFG2[WRDD]), there pre-amble may be extended for a full DRAM cycle. For this reason, we reference from DQSn.
- 5. All outputs are referenced to the rising edge of CK. Note that this is essentially the CK/DQSn skew in spec 208. In addition there is no real "maximum" time for the epilogue end. JEDEC does not require this is as a device limitation, but simply for the chip to guarantee fast enough write-to-read turn-around times. This is already guaranteed by the memory controller operation.

Figure 6 shows the DDR DRAM output timing diagram.

Figure 6. DDR DRAM Output Timing Diagram

#### **Electrical Characteristics**

Figure 7 provides the AC test load for the DDR DRAM bus.

Figure 7. DDR DRAM AC Test Load

| V <sub>TH</sub> <sup>1</sup>  |          |  | V <sub>REF</sub> ± 0.31 V | V    |
| V <sub>OUT</sub> <sup>2</sup> |          |  | $0.5 \times V_{DDM}$      | V    |
| Notes:                        | 1.<br>2. | Data input threshold measurement point. Data output measurement point. |                           |      |

# 2.5.5 TDM Timing

**Table 20. TDM Timing** 

| No. | Characteristic                               | Expression | Min  | Max  | Units |
|-----|--|------------|------|------|-------|
| 300 | TDMxRCK/TDMxTCK                              | TC         | 20.0 | _    | ns    |
| 301 | TDMxRCK/TDMxTCK High Pulse Width             | 0.4 × TC   | 8.0  | _    | ns    |
| 302 | TDMxRCK/TDMxTCK Low Pulse Width              | 0.4 × TC   | 8.0  | _    | ns    |
| 303 | TDM all input Setup time                     |            | 3.0  | _    | ns    |
| 304 | TDMxRD Hold time                             |            | 3.5  | _    | ns    |
| 305 | TDMxTFS/TDMxRFS input Hold time              |            | 2.0  | _    | ns    |
| 306 | TDMxTCK High to TDMxTD output active         |            | 4.0  | _    | ns    |
| 307 | TDMxTCK High to TDMxTD output valid          |            | _    | 14.0 | ns    |
| 308 | TDMxTD hold time                             |            | 2.0  | _    | ns    |
| 309 | TDMxTCK High to TDMxTD output high impedance |            | _    | 10.0 | ns    |
| 310 | TDMxTFS/TDMxRFS output valid                 |            | _    | 13.5 | ns    |
| 311 | TDMxTFS/TDMxRFS output hold time             |            | 2.5  | _    | ns    |

Notes: 1. Output values are based on 30 pF capacitive load.

<sup>2.</sup> Inputs are referenced to the sampling that the TDM is programmed to use. Outputs are referenced to the programming edge they are programmed to use. Use of the rising edge or falling edge as a reference is programmable. Refer to the MSC711x Reference Manual for details. TDMxTCK and TDMxRCK are shown using the rising edge.

| 64     | Maximum delay from DMA HACK (OAD=0) or Read/Write data  |                                       |         |      |
|        | strobe(OAD=1) assertion to HREQ deassertion   | $(5.0 \times T_{CORE}) + 6.0$         | Note 11 | ns   |
| Notos: | 1 T = core clock period At 300 MHz T = 3 333 ps   | <del></del>                           |         |      |

Notes:

- 1.  $T_{CORE}$  = core clock period. At 300 MHz,  $T_{CORE}$  = 3.333 ns.
- 2. In the timing diagrams below, the controls pins are drawn as active low. The pin polarity is programmable.
- 3.  $V_{DD} = 3.3 \text{ V} \pm 0.15 \text{ V}$ ;  $T_{J} = -40 ^{\circ}\text{C}$  to +105  $^{\circ}\text{C}$ ,  $C_{L} = 30 \text{ pF}$  for maximum delay timings and  $C_{L} = 0 \text{ pF}$  for minimum delay timings.
- 4. The read data strobe is HRD/HRD in the dual data strobe mode and HDS/HDS in the single data strobe mode.
- 5. For 64-bit transfers, the "last data register" is the register at address 0x7, which is the last location to be read or written in data transfers. This is RX0/TX0 in the little endian mode (HBE = 0), or RX3/TX3 in the big endian mode (HBE = 1).
- **6.** This timing is applicable only if a read from the "last data register" is followed by a read from the RX[0–3] registers without first polling RXDF or HREQ bits, or waiting for the assertion of the HREQ/HREQ signal.
- $\textbf{7.} \quad \text{This timing is applicable only if two consecutive reads from one of these registers are executed.}$
- 8. The write data strobe is HWR in the dual data strobe mode and HDS in the single data strobe mode.
- 9. The data strobe is host read (HRD/HRD) or host write (HWR/HWR) in the dual data strobe mode and host data strobe (HDS/HDS) in the single data strobe mode.
- 10. The host request is HREQ/HREQ in the single host request mode and HRRQ/HRRQ and HTRQ/HTRQ in the double host request mode. HRRQ/HRRQ is deasserted only when HOTX fifo is empty, HTRQ/HTRQ is deasserted only if HORX fifo is full
- 11. Compute the value using the expression.
- 12. The read and write data strobe minimum deassertion width for non-"last data register" accesses in single and dual data strobe modes is based on timings 57 and 58.

Figure 14 and Figure 15 show HDI16 read signal timing. Figure 16 and Figure 17 show HDI16 write signal timing.

| 68  |     | EVNT as output                          | Synchronous to core clock                      | 1 APBCLK period      |
| Notes: 1. Refer to Table 27 for a definition of the APBCLK period. 2. Direction of the EVNT signal is configured through the GPIO and Event port registers. 3. Refer to the signal chapter in the MSC711x Reference Manual for details on EVNT pin functionality. |     |   |  |                      |
| 3.  | Ref | er to the signal chapter in the MSC711x | <i>Reference Manual</i> for details on EVNT pi | n functionality.     |

Figure 24 shows the signal behavior of the EVNT pins.

Figure 24. EVNT Pin Timing

## 2.5.12 GPIO Timing

Table 30. GPIO Signal Timing 1,2,3

| Number | Characteristics                  | Туре                      | Min                             |
|--------|----------------------------------|---------------------------|---------------------------------|
| 601    | GPI <sup>4.5</sup>               | Asynchronous              | 1.5 × APBCLK periods            |
| 602    | GPO <sup>5</sup>                 | Synchronous to core clock | 1 APBCLK period                 |
| 603    | Port A edge-sensitive interrupt  | Asynchronous              | 1.5 × APBCLK periods            |
| 604    | Port A level-sensitive interrupt | Asynchronous              | 3 × APBCLK periods <sup>6</sup> |

Notes: 1. Refer to Table 27 for a definition of the APBCLK period.

- 2. Direction of the GPIO signal is configured through the GPIO port registers.
- 3. Refer to **Section 1.5** for details on GPIO pin functionality.
- 4. GPI data is synchronized to the APBCLK internally and the minimum listed is the capability of the hardware to capture data into a register when the GPADR is read. The specification is not tested due to the asynchronous nature of the input and dependence on the state of the DSP core. It is guaranteed by design.
- 5. The output signals cannot toggle faster than 75 MHz.
- Level-sensitive interrupts should be held low until the system determines (via the service routine) that the interrupt is acknowledged.

Figure 25 shows the signal behavior of the GPI/GPO pins.

Figure 25. GPI/GPO Pin Timing

# 2.5.13 JTAG Signals

# 3 Hardware Design Considerations

This section described various areas to consider when incorporating the MSC7119 device into a system design.

## 3.1 Thermal Design Considerations

An estimation of the chip-junction temperature, T<sub>I</sub>, in °C can be obtained from the following:

$$T_J = T_A + (R_{\Theta JA} \times P_D)$$
 Eqn. 1

where

 $T_A$  = ambient temperature near the package (°C)

 $R_{AIA}$  = junction-to-ambient thermal resistance (°C/W)

 $P_D = P_{INT} + P_{I/O} = power dissipation in the package (W)$ 

 $P_{INT} = I_{DD} \times V_{DD} = internal power dissipation (W)$ 

 $P_{I/O}$  = power dissipated from device on output pins (W)

The power dissipation values for the MSC7119 are listed in **Table 4**. The ambient temperature for the device is the air temperature in the immediate vicinity that would cool the device. The junction-to-ambient thermal resistances are JEDEC standard values that provide a quick and easy estimation of thermal performance. There are two values in common usage: the value determined on a single layer board and the value obtained on a board with two planes. The value that more closely approximates a specific application depends on the power dissipated by other components on the printed circuit board (PCB). The value obtained using a single layer board is appropriate for tightly packed PCB configurations. The value obtained using a board with internal planes is more appropriate for boards with low power dissipation (less than  $0.02 \text{ W/cm}^2$  with natural convection) and well separated components. Based on an estimation of junction temperature using this technique, determine whether a more detailed thermal analysis is required. Standard thermal management techniques can be used to maintain the device thermal junction temperature below its maximum. If  $T_J$  appears to be too high, either lower the ambient temperature or the power dissipation of the chip.

You can verify the junction temperature by measuring the case temperature using a small diameter thermocouple (40 gauge is recommended) or an infrared temperature sensor on a spot on the device case. Use the following equation to determine T<sub>I</sub>:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$
 Eqn. 2

where

 $T_T$  = thermocouple (or infrared) temperature on top of the package (°C)

 $\Psi_{JT}$  = thermal characterization parameter (°C/W)

 $P_D$  = power dissipation in the package (W)

## 3.2 Power Supply Design Considerations

This section outlines the MSC7119 power considerations: power supply, power sequencing, power planes, decoupling, power supply filtering, and power consumption. It also presents a recommended power supply design and options for low-power consumption. For information on AC/DC electrical specifications and thermal characteristics, refer to **Section 2**.

• Power Supply. The MSC7119 requires four input voltages, as shown in **Table 32**.

 Voltage
 Symbol
 Value

 VDDC
 1.2 V

 VDDM
 2.5 V

 VREF
 1.25 V

3.3 V

Table 32. MSC7119 Voltages

You should supply the MSC7119 core voltage via a variable switching supply or regulator to allow for compatibility with possible core voltage changes on future silicon revisions. The core voltage is supplied with 1.2 V (+5% and -10%) across  $V_{DDC}$  and GND and the I/O section is supplied with 3.3 V (± 10%) across  $V_{DDIO}$  and GND. The memory and reference voltages supply the DDR memory controller block. The memory voltage is supplied with 2.5 V across  $V_{DDM}$  and GND. The reference voltage is supplied across  $V_{REF}$  and GND and must be between  $0.49 \times V_{DDM}$  and  $0.51 \times V_{DDM}$ . Refer to the JEDEC standard JESD8 (*Stub Series Terminated Logic for 2.5 Volts* (STTL\_2)) for memory voltage supply requirements.

 $V_{DDIO}$ 

- *Power sequencing*. One consequence of multiple power supplies is that the voltage rails ramp up at different rates when power is initially applied. The rates depend on the power supply, the type of load on each power supply, and the way different voltages are derived. It is extremely important to observe the power up and power down sequences at the board level to avoid latch-up, forward biasing of ESD devices, and excessive currents, which all lead to severe device damage. The correct power-up sequence is as follows:
  - Turn on the highest supply first (3.3 V).
  - Turn on the 2.5 V supply.
  - Turn on the lowest supply last (1.2 V).

The correct power-down sequence is as follows:

- Turn off the lowest supply first (1.2 V).
- Turn off the 2.5 V supply.
- Turn off the highest supply last (3.3 V).

At any instant during power-up and power-down, the 2.5 V supply must maintain a differential of +0.7 V or more below the 3.3 V supply. Also, at any instant, the 1.2 V supply must maintain a differential of +0.7 V or more below the 2.5 V supply, as shown in Figure 30. The power-down sequence is not as critical as the power-up sequence.

43

Figure 30. Voltage Sequencing

- Power planes. Each power supply pin (V<sub>DDC</sub>, V<sub>DDM</sub>, and V<sub>DDIO</sub>) should have a low-impedance path to the board power supply. Each GND pin should be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on the device. The MSC7119 V<sub>DDC</sub> power supply pins should be bypassed to ground using decoupling capacitors. The capacitor leads and associated printed circuit traces connecting to device power pins and GND should be kept to less than half an inch per capacitor lead. A minimum four-layer board that employs two inner layers as power and GND planes is recommended. See Section 3.5 for DDR Controller power guidelines.
- Decoupling. Both the I/O voltage and core voltage should be decoupled for switching noise. For I/O decoupling, use standard capacitor values of 0.01 μF for every two to three voltage pins. For core voltage decoupling, use two levels of decoupling. The first level should consist of a 0.01 μF high frequency capacitor with low effective series resistance (ESR) and effective series inductance (ESL) for every two to three voltage pins. The second decoupling level should consist of two bulk/tantalum decoupling capacitors, one 10 μF and one 47 μF, (with low ESR and ESL) mounted as closely as possible to the MSC7119 voltage pins. Additionally, the maximum drop between the power supply and the DSP device should be 15 mV at 1 A.
- PLL power supply filtering. The MSC7119  $V_{DDPLL}$  power signal provides power to the clock generation PLL. To ensure stability of the internal clock, the power supplied to this pin should be filtered with capacitors that have low and high frequency filtering characteristics.  $V_{DDPLL}$  can be connected to  $V_{DDC}$  through a 20  $\Omega$  resistor.  $V_{SSPLL}$  can be tied directly to the GND plane. A circuit similar to the one shown in **Figure 31** is recommended. The PLL loop filter should be placed as closely as possible to the  $V_{DDPLL}$  pin (which are located on the outside edge of the silicon package) to minimize noise coupled from nearby circuits. The 0.01  $\mu$ F capacitor should be closest to  $V_{DDPLL}$ , followed by the 0.1  $\mu$ F capacitor, the 10  $\mu$ F capacitor, and finally the 20- $\Omega$  resistor to  $V_{DDC}$ . These traces should be kept short.

Figure 31. PLL Power Supply Filter Circuits

#### **Hardware Design Considerations**

- *Power consumption.* You can reduce power consumption in your design by controlling the power consumption of the following regions of the device:
  - Extended core. Use the SC1400 Stop and Wait modes by issuing a **stop** or **wait** instruction.
  - Clock synthesis module. Disable the PLL, timer, watchdog, or DDR clocks or disable the CLKO pin.
  - AHB subsystem. Freeze or shut down the AHB subsystem using the GPSCTL[XBR\_HRQ] bit.
  - Peripheral subsystem. Halt the individual on-device peripherals such as the DDR memory controller, Ethernet MAC, HDI16, TDM, UART, I<sup>2</sup>C, and timer modules.

For details, see the "Clocks and Power Management" chapter of the MSC711x Reference Manual.

• *Power supply design*. One of the most common ways to derive power is to use either a simple fixed or adjustable linear regulator. For the system I/O voltage supply, a simple fixed 3.3 V supply can be used. However, a separate adjustable linear regulator supply for the core voltage VDDC should be implemented. For the memory power supply, regulators are available that take care of all DDR power requirements.

| Supply    | Symbol           | Nominal Voltage | Current Rating   |
|-----------|------------------|-----------------|------------------|
| Core      | V <sub>DDC</sub> | 1.2 V           | 1.5 A per device |
| Memory    | V <sub>DDM</sub> | 2.5 V           | 0.5 A per device |
| Reference | V <sub>REF</sub> | 1.25 V          | 10 μA per device |
| I/O       | $V_{\rm DDIO}$   | 3.3 V           | 1.0 A per device |

**Table 33. Recommended Power Supply Ratings** 

## 3.3 Estimated Power Usage Calculations

The following equations permit estimated power usage to be calculated for individual design conditions. Overall power is derived by totaling the power used by each of the major subsystems:

$$P_{TOTAL} = P_{CORE} + P_{PERIPHERALS} + P_{DDRIO} + P_{IO} + P_{LEAKAGE}$$
 Eqn. 3

This equation combines dynamic and static power. Dynamic power is determined using the generic equation:

$$C \times V^2 \times F \times 10^{-3} \text{ mW}$$
 Eqn. 4

where.

C = load capacitance in pF

V = peak-to-peak voltage swing in V

F = frequency in MHz

### 3.3.1 Core Power

Estimation of core power is straightforward. It uses the generic dynamic power equation and assumes that the core load capacitance is 750 pF, core voltage swing is 1.2 V, and the core frequency is 300 MHz. This yields:

$$P_{CORE} = 750 \text{ pF} \times (1.2 \text{ V})^2 \times 300 \text{ MHz} \times 10^{-3} = 324.0 \text{ mW}$$
 Eqn. 5

This equation allows for adjustments to voltage and frequency if necessary.

## 3.3.2 Peripheral Power

Peripherals include the DDR memory controller, Ethernet controller, DMA controller, HDI16, TDM, UART, timers, GPIOs, and the I<sup>2</sup>C module. Basic power consumption by each module is assumed to be the same and is computed by using the following equation which assumes an effective load of 20 pF, core voltage swing of 1.2 V, and a switching frequency of 100 MHz. This yields:

$$P_{PERIPHERAL} = 20 \text{ pF} \times (1.2 \text{ V})^2 \times 150 \text{ MHz} \times 10^{-3} = 4.32 \text{ mW per peripheral}$$
 Eqn. 6

Multiply this value by the number of peripherals used in the application to compute the total peripheral power consumption.

### 3.3.3 External Memory Power

Estimation of power consumption by the DDR memory system is complex. It varies based on overall system signal line usage, termination and load levels, and switching rates. Because the DDR memory includes terminations external to the MSC7119 device, the 2.5 V power source provides the power for the termination, which is a static value of 16 mA per signal driven high. The dynamic power is computed, however, using a differential voltage swing of  $\pm 0.200$  V, yielding a peak-to-peak swing of 0.4 V. The equations for computing the DDR power are:

$$P_{DDRIO} = P_{STATIC} + P_{DYNAMIC}$$
 Eqn. 7

$$P_{STATIC} = (unused pins \times \% driven high) \times 16 \text{ mA} \times 2.5 \text{ V}$$
 Eqn. 8

$$P_{DYNAMIC} = (pin \ activity \ value) \times 20 \ pF \times (0.4 \ V)^2 \times 300 \ MHz \times 10^{-3} \ mW$$
 Eqn. 9

pin activity value = (active data lines  $\times$  % activity  $\times$  % data switching) + (active address lines  $\times$  % activity) Eqn. 10

As an example, assume the following:

unused pins = 16 (DDR uses 16-pin mode)

% driven high = 50%

active data lines = 16

% activity = 60%

% data switching = 50%

active address lines = 3

In this example, the DDR memory power consumption is:

$$P_{DDRIO} = ((16 \times 0.5) \times 16 \times 2.5) + (((16 \times 0.6 \times 0.5) + (3 \times 0.6)) \times 20 \times (0.4)^{2} \times 300 \times 10^{-3}) = 326.3 \text{ mW}$$
 Eqn. 11

### 3.3.4 External I/O Power

The estimation of the I/O power is similar to the computation of the peripheral power estimates. The power consumption per signal line is computed assuming a maximum load of 20 pF, a voltage swing of 3.3 V, and a switching frequency of 25 MHz, which yields:

$$P_{IO} = 20 \text{ pF} \times (3.3 \text{ V})^2 \times 25 \text{ MHz} \times 10^{-3} = 5.44 \text{ mW per I/O line}$$
 Eqn. 12

Multiply this number by the number of I/O signal lines used in the application design to compute the total I/O power.

**Note:** The signal loading depends on the board routing. For systems using a single DDR device, the load could be as low as 7 pF.

## 3.3.5 Leakage Power

The leakage power is for all power supplies combined at a specific temperature. The value is temperature dependent. The observed leakage value at room temperature is 64 mW.

MSC7119 10/100 Mbps Ethernet MAC Data Sheet, Rev. 6

## 3.3.6 Example Total Power Consumption

Using the examples in this section and assuming four peripherals and 10 I/O lines active, a total power consumption value is estimated as the following:

$$P_{TOTAL} = 324.0 + (4 \times 4.32) + 326.3 + (10 \times 5.44) + 64 = 784.98 \text{ mW}$$
 Eqn. 13

## 3.4 Reset and Boot

This section describes the recommendations for configuring the MSC7119 at reset and boot.

### 3.4.1 Reset Circuit

HRESET is a bidirectional signal and, if driven as an input, should be driven with an open collector or open-drain device. For an open-drain output such as  $\overline{\text{HRESET}}$ , take care when driving many buffers that implement input bus-hold circuitry. The bus-hold currents can cause enough voltage drop across the pull-up resistor to change the logic level to low. Either a smaller value of pull-up or less current loading from the bus-hold drivers overcomes this issue. To avoid exceeding the MSC7119 output current, the pull-up value should not be too small (a 1 K $\Omega$  pull-up resistor is used in the MSC711xADS reference design).

## 3.4.2 Reset Configuration Pins

**Table 34** shows the MSC7119 reset configuration signals. These signals are sampled at the deassertion (rising edge) of PORESET. For details, refer to the Reset chapter of the MSC711x Reference Manual.

| Signal  | Description                        | Settings                                      |  |  |
|---------|------------------------------------|---|--|--|
| BM[3-0] | Determines boot mode.              | See <b>Table 35</b> for details.              |  |  |
| SWTE    | Determines watchdog functionality. | 0 Watchdog timer disabled.                    |  |  |
|         |                                    | 1 Watchdog timer enabled.                     |  |  |
| HDSP    | Configures HDI16 strobe polarity.  | 0 Host Data strobes active low.               |  |  |
|         |                                    | 1 Host Data strobes active high.              |  |  |
| H8BIT   | Configures HDI16 operation mode.   | 0 HDI16 port configured for 16-bit operation. |  |  |
|         |                                    | 1 HDI16 port configured for 8-bit operation.  |  |  |

3. F<sub>max</sub> is determined by the maximum frequency of the peripheral and of the SC1400 core as specified in the data sheet.

### 3.4.3 Boot

After a power-on reset, the PLL is bypassed and the device is directly clocked from the CLKIN pin. Thus, the device operates slowly during the boot process. After the boot program is loaded, it can enable the PLL and start the device operating at a higher speed. The MSC7119 can boot from an external host through the HDI16 or download a user program through the I<sup>2</sup>C port. The boot operating mode is set by configuring the BM[0–3] signals sampled at the rising edge of PORESET, as shown in **Table 35**. See the *MSC711x Reference Manual* for details of boot program operation.

### 3.4.3.1 HDI16 Boot

If the MSC7119 device boots from an external host through the HDI16, the port is configured as follows:

- Operate in Non-DMA mode.
- Operate in polled mode on the device side.
- Operate in polled mode on the external host side.
- External host must write four 16-bit values at a time with the first word as the most significant and the fourth word as the least significant.

MSC7119 10/100 Mbps Ethernet MAC Data Sheet, Rev. 6

### **Hardware Design Considerations**

When booting from a power-on reset, the HDI16 is additionally configurable as follows:

- 8- or 16-bit mode as specified by the H8BIT pin.
- Data strobe as specified by the HDSP and HDDS pins.

These pins are sampled only on the deassertion of power-on reset. During a boot from a hard reset, the configuration of these pins is unaffected.

**Note:** When the HDI16 is used for booting or other purposes, bit 0 is the least significant bit and not the most significant bit as for other DSP products.

### 3.4.3.2 I<sup>2</sup>C Boot

When the MSC7119 device is configured to boot from the  $I^2C$  port, the boot program configures the GPIO pins for  $I^2C$  operation. Then the MSC7118 device initiates accesses to the  $I^2C$  module, downloading data to the MSC7118 device. The  $I^2C$  interface is configured as follows:

- PLL is disabled and bypassed so that the I<sup>2</sup>C module is clocked with the IPBus clock.
- I<sup>2</sup>C interface operates in master mode and polling is used.
- EPROM operates in slave mode.
- Clock divider is set to 128.
- Address of slave during boot is 0xA0.

The IPBus clock is internally divided to generate the bit clock, as follows:

- CLKIN must be a maximum of 100 MHz
- PLL is bypassed.
- IPBus clock = CLKIN/2 is a maximum of 50 MHz.
- I<sup>2</sup>C bit clock must be less than or equal to:
  - IPBus clock/I<sup>2</sup>C clock divider
  - 50 MHz (max)/128
  - 390.6 KHz

This satisfies the maximum clock rate requirement of 400 kbps for the  $I^2C$  interface. For details on the boot procedure, see the "Boot Program" chapter of the MSC711x Reference Manual.

### 3.4.3.3 SPI Boot

When the MSC7119 device is configured to boot from the SPI port, the boot program configures the GPIO pins for SPI operation. Then the MSC7118 device initiates accesses to the SPI module, downloading data to the MSC7118 device. When the SPI routines run in the boot ROM, the MSC7118 is always configured as the SPI master. Booting through the SPI is supported for serial EEPROM devices and serial Flash devices. When a READ\_ID instruction is issued to the serial memory device and the device returns a value of 0x00 or 0xFF, the routines for accessing a serial EEPROM are used, at a maximum frequency of 4 Mbps. Otherwise, the routines for accessing a serial Flash are used, and they can run at faster speeds. Booting is performed through one of two sets of pins:

- Main set: BM[2–3], HA3, and HCS2, which allow use of the PLL.
- Alternate set: UTXD, URXD, SDA, and SCL, which cannot be used with the PLL.

In either configuration, an error during SPI boot is flagged on the EVNT3 pin. For details on the boot procedure, see the "Boot Program" chapter of the *MSC711x Reference Manual*.

# 3.5 DDR Memory System Guidelines

MSC7119 devices contain a memory controller that provides a glueless interface to external double data rate (DDR) SDRAM memory modules with Class 2 Series Stub Termination Logic 2.5 V (SSTL\_2). There are two termination techniques, as shown in Figure 32. Technique B is the most popular termination technique.

Figure 32. SSTL Termination Techniques

Figure 33 illustrates the power wattage for the resistors. Typical values for the resistors are as follows:

- $RS = 22 \Omega$
- $RT = 24 \Omega$

Figure 33. SSTL Power Value

## 3.5.1 V<sub>REF</sub> and V<sub>TT</sub> Design Constraints

 $V_{TT}$  and  $V_{REF}$  are isolated power supplies at the same voltage, with  $V_{TT}$  as a high current power source. This section outlines the voltage supply design needs and goals:

- Minimize the noise on both rails.
- V<sub>TT</sub> must track variation in the V<sub>REF</sub> DC offsets. Although they are isolated supplies, one possible solution is to use a single IC to generate both signals.
- Both references should have minimal drift over temperature and source supply.
- It is important to minimize the noise from coupling onto V<sub>REF</sub> as follows:
  - Isolate V<sub>REF</sub> and shield it with a ground trace.
  - Use 15–20 mm track.
  - Use 20–30 mm clearance between other traces for isolating.
  - Use the outer layer route when possible.
  - Use distributed decoupling to localize transient currents and return path and decouple with an inductance less than 3 nH.
- Max source/sink transient currents of up to 1.8 A for a 32-bit data bus.
- Use a wide island trace on the outer layer:
  - Place the island at the end of the bus.
  - Decouple both ends of the bus.
  - Use distributed decoupling across the island.
  - Place SSTL termination resistors inside the V<sub>TT</sub> island and ensure a good, solid connection.
- Place the V<sub>TT</sub> regulator as closely as possible to the termination island.
  - Reduce inductance and return path.
  - Tie current sense pin at the midpoint of the island.

## 3.5.2 Decoupling

The DDR decoupling considerations are as follows:

- DDR memory requires significantly more burst current than previous SDRAMs.
- In the worst case, up to 64 drivers may be switching states.
- Pay special attention and decouple discrete ICs per manufacturer guidelines.
- Leverage V<sub>TT</sub> island topology to minimize the number of capacitors required to supply the burst current needs of the termination rail.
- See the Micron DesignLine publication entitled *Decoupling Capacitor Calculation for a DDR Memory Channel* (http://download.micron.com/pdf/pubs/designline/3Q00dl1-4.pdf).

## 3.5.3 General Routing

The general routing considerations for the DDR are as follows:

- All DDR signals must be routed next to a solid reference:
  - For data, next to solid ground planes.
  - For address/command, power planes if necessary.
- All DDR signals must be impedance controlled. This is system dependent, but typical values are 50–60 ohm.
- Minimize other cross-talk opportunities. As possible, maintain at least a four times the trace width spacing between all DDR signals to non-DDR signals.
- Keep the number of vias to a minimum to eliminate additional stubs and capacitance.
- Signal group routing priorities are as follows:
  - DDR clocks.
  - Route MVTT/MVREF.
  - Data group.
  - Command/address.
- Minimize data bit jitter by trace matching.

## 3.5.4 Routing Clock Distribution

The DDR clock distribution considerations are as follows:

- DDR controller supports six clock pairs:
  - 2 DIMM modules.
  - Up to 36 discrete chips.
- For route traces as for any other differential signals:
  - Maintain proper difference pair spacing.
  - Match pair traces within 25 mm.
- Match all clock traces to within 100 mm.
- Keep all clocks equally loaded in the system.
- Route clocks on inner critical layers.

## 3.5.5 Data Routing

The DDR data routing considerations are as follows:

- Route each data group (8-bits data + DQS + DM) on the same layer. Avoid switching layers within a byte group.
- Take care to match trace lengths, which is extremely important.
- To make trace matching easier, let adjacent groups be routed on alternate critical layers.
- Pin swap bits within a byte group to facilitate routing (discrete case).
- Tight trace matching is recommended within the DDR data group. Keep each 8-bit datum and its DM signal within ± 25 mm of its respective strobe.
- Minimize lengths across the entire DDR channel:
  - Between all groups maintain a delta of no more than 500 mm.
  - Allows greater flexibility in the design for readjustments as needed.
- DDR data group separation:
  - If stack-up allows, keep DDR data groups away from the address and control nets.
  - Route address and control on separate critical layers.
  - If resistor networks (RNs) are used, attempt to keep data and command lines in separate packages.

## 3.6 Connectivity Guidelines

This section summarizes the connections and special conditions, such as pull-up or pull-down resistors, for the MSC7119 device. Following are guidelines for signal groups and configuration settings:

- Clock and reset signals.
  - SWTE is used to configure the MSC7119 device and is sampled on the deassertion of PORESET, so it should be tied to V<sub>DDC</sub> or GND either directly or through pull-up or pull-down resistors until PORESET is deasserted. After PORESET, this signal can be left floating.
  - BM[0-1] configure the MSC7119 device and are sampled until PORESET is deasserted, so they should be tied to V<sub>DDIO</sub> or GND either directly or through pull-up or pull-down resistors.
  - HRESET should be pulled up.
- Interrupt signals. When used,  $\overline{IRQ}$  pins must be pulled up.
- HDI16 signals.
  - When they are configured for open-drain, the HREQ/HREQ or HTRQ/HTRQ signals require a pull-up resistor. However, these pins are also sampled at power-on reset to determine the HDI16 boot mode and may need to be pulled down. When these pins must be pulled down on reset and pulled up otherwise, a buffer can be used with the HRESET signal as the enable.
  - When the device boots through the HDI16, the HDDS, HDSP and H8BIT pins should be pulled up or down, depending on the required boot mode settings.
- Ethernet MAC/TDM2 signals. The MDIO signal requires an external pull-up resistor.
- $I^2C$  signals. The SCL and SDA signals, when programmed for  $I^2C$ , requires an external pull-up resistor.
- General-purpose I/O (GPIO) signals. An unused GPIO pin can be disconnected. After boot, program it as an output pin.
- Other signals.
  - The TESTO pin must be connected to ground.
  - The TPSEL pin should be pulled up to enable debug access via the EOnCE port and pulled down for boundary scan.
  - Pins labelled NO CONNECT (NC) must not be connected.
  - When a 16-pin double data rate (DDR) interface is used, the 16 unused data pins should be no connects (floating) if the used lines are terminated.
  - Do not connect DBREQ to DONE (as you would for the MSC8101 device). Connect DONE to one of the EVNT pins, and DBREQ to HRRQ.

# 4 Ordering Information

Consult a Freescale Semiconductor sales office or authorized distributor to determine product availability and place an order.

| Part    | Supply Voltage             | Package Type                                      | Pin<br>Count | Core<br>Frequency<br>(MHz) | Solder Spheres | Order Number  |
|---------|----------------------------|---|--------------|----------------------------|----------------|---------------|
| MSC7119 | 1.2 V core<br>2.5 V memory | Molded Array Process-Ball Grid<br>Array (MAP-BGA) | 400          | 300                        | Lead-free      | MSC7119VM1200 |
|         | 3.3 V I/O                  | Allay (MATE BOTT)                                 |              |                            | Lead-bearing   | MSC7119VF1200 |

# 5 Package Information

Figure 34. MSC7119 Mechanical Information, 400-pin MAP-BGA Package

## 6 Product Documentation

- *MSC711x Reference Manual* (MSC711xRM). Includes functional descriptions of the extended cores and all the internal subsystems including configuration and programming information.
- Application Notes. Cover various programming topics related to the StarCore DSP core and the MSC7119 device.
- *SC140/SC1400 DSP Core Reference Manual*. Covers the SC140 and SC1400 core architecture, control registers, clock registers, program control, and instruction set.

# 7 Revision History

Table 36 provides a revision history for this data sheet.

**Table 36. Document Revision History** 

| Revision | Date      | Description   |
|----------|-----------|---|
| 0        | Sep. 2005 | Initial public release.   |
| 1        | Oct 2005  | Added explanatory note to HDI16 timing table.   |
| 2        | Oct. 2005 | <ul> <li>Added information about signals GPIOB11, GPIOC11, GPIOD7, and GPIOD8 to the signal descriptions<br/>and pinout location lists.</li> </ul>  |
| 3        | Dec. 2005 | Added information about signals GPIOA16, GPIOA17, GPIOA27, GPIOA28, and GPIOA29 to signal description and pinout location lists.  |
| 4        | Feb. 2006 | Updated orderable part numbers.   |
| 5        | Nov. 2006 | <ul> <li>Updated Reference Manual reference to MSC711x Reference Manual.</li> <li>Updated arrows in Host DMA Writing Timing figure.</li> </ul>  |
| 6        | Jun. 2007 | <ul> <li>Updated to new data sheet format. Reorganized and renumbered sections, figures, and tables.</li> <li>Added a note to clarify the definition of TCK timing 700 in new Table 31.</li> <li>Removed references to V<sub>CCSYN</sub> and V<sub>CCSYN1</sub> in the new power supply design recommendation Section 3.2.</li> </ul> |

MSC7119 10/100 Mbps Ethernet MAC Data Sheet, Rev. 6

Rev. 6 7/2007 Information in this document is provided solely to enable system and software implementers to use Freescale Semiconductor products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters that may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.

RoHS-compliant and/or Pb-free versions of Freescale products have the functionality and electrical characteristics as their non-RoHS-compliant and/or non-Pb-free counterparts. For further information, see <a href="http://www.freescale.com">http://www.freescale.com</a> or contact your Freescale sales representative.
