## FEATURES

- 2A Output Current
- Up to $95 \%$ Efficiency
- Up to 30V Input Range
- $6 \mu \mathrm{~A}$ Shutdown Supply Current
- 400kHz Switching Frequency
- Adjustable Output Voltage
- Cycle-by-Cycle Current Limit Protection
- Thermal Shutdown Protection
- Frequency FoldBack at Short Circuit
- Stability with Wide Range of Capacitors, Including Low ESR Ceramic Capacitors
- SOP-8 Package

## APPLICATIONS

- TFT LCD Monitors or Televisions and HDTV
- Portable DVD Players
- Car-Powered or Battery-Powered Equipment
- Set-Top Boxes
- Telecom Power Supplies
- DSL and Cable Modems and Routers

## GENERAL DESCRIPTION

The ACT4072 is a current-mode step-down DC/DC converter that generates up to 2A output current at 400 kHz switching frequency. The device utilizes Active-Semi's proprietary ISOBCD30 process for operation with input voltage up to 30 V .

Consuming only $6 \mu \mathrm{~A}$ in shutdown mode, the ACT4072 is highly efficient with peak efficiency at $95 \%$ when in operation. Protection features include cycle-by-cycle current limit, thermal shutdown, and frequency foldback at short circuit.
The ACT4072 is available in SOP-8 package and requires very few external devices for operation.

## TYPICAL APPLICATION CIRCUIT

## ORDERING INFORMATION

| PART NUMBER | TEMPERATURE RANGE | PACKAGE | PINS | PACKING |
| :---: | :---: | :---: | :---: | :---: |
| ACT4072SH | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | SOP-8 | 8 | TUBE |
| ACT $4072 \mathrm{SH}-\mathrm{T}$ | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | SOP- 8 | 8 | TAPE \& REEL |

## PIN CONFIGURATION

## PIN DESCRIPTION

| PIN <br> NUMBER | PIN NAME | PIN DESCRIPTION |
| :---: | :---: | :--- |
| 1 | BS | Bootstrap. This pin acts as the positive rail for the high-side switch's gate driver. Con- <br> nect a 10nF between this pin and SW. |
| 2 | IN | Input Supply. Bypass this pin to G with a low ESR capacitor. See Input Capacitor in Ap- <br> plication Information section. |
| 3 | SW | Switch Output. Connect this pin to the switching end of the inductor. |
| 4 | G | Ground. |
| 5 | FB | Feedback Input. The voltage at this pin is regulated to 1.222V. Connect to the resistor <br> divider between the output and ground to set output voltage. |
| 6 | COMP | Compensation Pin. See Compensation Techniques in Application Information section. |
| 7 | EN | Enable Input. Drive higher than 1.3V or leave unconnected to enable the IC. Drive lower <br> than 0.7V to disable the IC. When disabled, the IC is in 6 4 A low current shutdown mode <br> and the output is discharged through the Low-Side Power Switch. This pin has a small <br> internal pull up current to a high level voltage when pin is not connected. |
| 8 | N/C | Not Connected. |

ACT4072

## ABSOLUTE MAXIMUM RATINGS ${ }^{\circledR}$

| PARAMETER | VALUE | UNIT |
| :--- | :---: | :---: |
| IN to $G$ | -0.3 to +34 | V |
| EN to G | -0.3 to $\mathrm{V}_{\mathrm{IN}}+0.3$ | V |
| SW to G | -1 to $\mathrm{V}_{\mathrm{IN}}+1$ | V |
| BS to SW | -0.3 to +8 | V |
| FB, COMP to G | -0.3 to +6 | V |
| Continuous SW Current | Internally limited | A |
| Junction to Ambient Thermal Resistance $\left(\theta_{\mathrm{JA}}\right)$ | 105 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| Maximum Power Dissipation | 0.76 | W |
| Operating Junction Temperature | -40 to 150 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | -55 to 150 | ${ }^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering, 10 sec) | 300 | ${ }^{\circ} \mathrm{C}$ |
| Ambient Operating Temperature | -40 to 85 | ${ }^{\circ} \mathrm{C}$ |

(1): Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

$\left(\mathrm{V}_{\mathrm{IN}}=12 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}\right.$, unless otherwise specified.)

| PARAMETER | SYMBOL | TEST CONDITIONS | MIN | TYP | MAX | UNIT |

## FUNCTIONAL BLOCK DIAGRAM

## FUNCTIONAL DESCRIPTION

As seen in the Functional Block Diagram, the ACT4072 is a current mode pulse width modulation (PWM) converter. The converter operates as follows:

A switching cycle starts when the rising edge of the Oscillator clock output causes the High-Side Power Switch to turn on and the Low-Side Power Switch to turn off. With the SW side of the inductor now connected to IN, the inductor current ramps up to store energy in its magnetic field. The inductor current level is measured by the Current Sense Amplifier and added to the Oscillator ramp signal. If the resulting summation is higher than the COMP voltage, the output of the PWM Comparator goes high. When this happens or when Oscillator clock output goes low, the High-Side Power Switch turns off and the Low-Side Power Switch turns on. At this point, the SW side of the inductor swings to a diode voltage below ground, causing the inductor current to decrease and magnetic energy to be transferred to the output. This state continues until the cycle starts again.

The High-Side Power Switch is driven by logic using the BS bootstrap pin as the positive rail. This pin is charged to $\mathrm{V}_{\mathrm{SW}}+6 \mathrm{~V}$ when the Low-Side Power Switch turns on.

The COMP voltage is the integration of the error between the FB input and the internal 1.222 V reference. If $F B$ is lower than the reference voltage, COMP tends to go higher to increase current to the output. Current limit happens when COMP reaches its maximum clamp value of 2.55 V .
The Oscillator normally switches at 400 kHz . However, if the FB voltage is less than 0.7 V , then the switching frequency decreases until it reaches a minimum of 60 kHz at $\mathrm{V}_{\mathrm{FB}}=0.5 \mathrm{~V}$.

## Shutdown Control

The ACT4072 has an enable input EN for turning the IC on or off. When EN is less than 0.7 V , the IC is in $6 \mu \mathrm{~A}$ low current shutdown mode and the output is discharged through the Low-Side Power Switch. When EN is higher than 1.3 V , the IC is in normal operation mode. EN is internally pulled up with a $2 \mu \mathrm{~A}$ current source and can be left unconnected for always-on operation.

## Thermal Shutdown

The ACT4072 automatically turns off when its junction temperature exceeds $160^{\circ} \mathrm{C}$.

## APPLICATIONS INFORMATION

## Output Voltage Setting

Figure 1 shows the connections for setting the output voltage. Select the proper ratio of the two feedback resistors $R_{F B 1}$ and $R_{F B 2}$ based on the output voltage. Typically, use $R_{\text {FB2 }} \approx 10 \mathrm{k} \Omega$ and determine $R_{\text {FB1 }}$ from the output voltage:

$$
\begin{equation*}
R_{F B 1}=R_{F B 2}\left(\frac{V_{\text {OUT }}}{1.222 V}-1\right) \tag{1}
\end{equation*}
$$

Figure 1:

## Output Voltage Setting

## Inductor Selection

The inductor maintains a continuous current to the output load. This inductor current has a ripple that is dependent on the inductance value: higher inductance reduces the peak-to-peak ripple current. The trade off for high inductance value is the increase in inductor core size and series resistance, and the reduction in current handling capability. In general, select an inductance value $L$ based on ripple current requirement:

$$
\begin{equation*}
L=\frac{V_{\text {OUT }} \times\left(V_{\text {IN }}-V_{\text {OUT }}\right)}{V_{\text {IN }} f_{\text {SW }} I_{\text {OUTMAX }} K_{\text {RIPPLE }}} \tag{2}
\end{equation*}
$$

where $\mathrm{V}_{\mathbb{I N}}$ is the input voltage, $\mathrm{V}_{\text {OUt }}$ is the output voltage, $\mathrm{f}_{\mathrm{SW}}$ is the switching frequency, loutmax is the maximum output current, and $\mathrm{K}_{\text {RIPPLE }}$ is the ripple factor. Typically, choose $\mathrm{K}_{\text {RIPPLE }}=20 \%$ to $30 \%$ corresponding to the peak-to-peak ripple current being $20 \%$ to $30 \%$ of the maximum output current.

With this inductor value (Table 1), the peak inductor current is $\mathrm{l}_{\text {OUT }} \times\left(1+\mathrm{K}_{\text {RIPPLE }} / 2\right)$. Make sure that this peak inductor current is less that the 2.4A current limit. Finally, select the inductor core size so that it does not saturate at 2.4A.

Table 1:
Typical Inductor Values

| V $_{\text {OUt }}$ | $\mathbf{1 . 5 V}$ | $\mathbf{1 . 8 V}$ | $\mathbf{2 . 5 V}$ | $\mathbf{3 . 3 V}$ | $\mathbf{5 V}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| L | $6.8 \mu \mathrm{H}$ | $6.8 \mu \mathrm{H}$ | $10 \mu \mathrm{H}$ | $15 \mu \mathrm{H}$ | $22 \mu \mathrm{H}$ |

## Input Capacitor

The input capacitor needs to be carefully selected to maintain sufficiently low ripple at the supply input of the converter. A low ESR capacitor is highly recommended. Since a large current flows in and out of this capacitor during switching, its ESR also affects efficiency.

The input capacitance needs to be higher than $10 \mu \mathrm{~F}$. The best choice is the ceramic type, however, low ESR tantalum or electrolytic types may also be used provided that the RMS ripple current rating is higher than $50 \%$ of the output current. The input capacitor should be placed close to the IN and G pins of the IC, with shortest possible traces. In the case of tantalum or electrolytic types, they can be further away if a small parallel $0.1 \mu \mathrm{~F}$ ceramic capacitor is placed right next to the IC.

## Output Capacitor

The output capacitor also needs to have low ESR to keep low output voltage ripple. The output ripple voltage is:
$R_{\text {RIPPLE }}=L_{\text {OUTMAX }} K_{\text {RIPPLE }} R_{\text {ESR }}$
$+\frac{V_{\text {IN }}}{28 f_{\text {SW }}{ }^{2} L C_{\text {OUT }}}$
where loutmax is the maximum output current, $\mathrm{K}_{\text {RIPPLE }}$ is the ripple factor, $\mathrm{R}_{\mathrm{ESR}}$ is the ESR resistance of the output capacitor, $f_{s w}$ is the switching frequency, $L$ is the inductor value, $C_{\text {out }}$ is the output capacitance.

In the case of ceramic output capacitors, $R_{\text {ESR }}$ is very small and does not contribute to the ripple. Therefore, a lower capacitance value can be used for ceramic type, typically choose a capacitance of about $22 \mu \mathrm{~F}$.
In the case of tantalum or electrolytic type, the ripple is dominated by $R_{E S R}$ multiplied by the ripple current. In that case, the output capacitor is chosen to have sufficiently low due to ESR, typically choose a capacitor with less than $50 \mathrm{~m} \Omega$ ESR.

## Rectifier Diode

Use a Schottky diode as the rectifier to conduct current when the High-Side Power Switch is off. The Schottky diode must have current rating higher than the maximum output current and the reverse voltage rating higher than the maximum input voltage.

## Stability compensation

Figure 2:
Stability Compensation

(1): $\mathrm{C}_{\text {COMP2 }}$ is needed only for high ESR output capacitors or PCB parasitics

The feedback system of the IC is stabilized by the components at the COMP pin, as shown in Figure 2. The DC loop gain of the system is determined by the following equation:

$$
\begin{equation*}
A_{V D C}=\frac{1.222 V}{l_{O U T}} A_{V E A} G_{C O M P} \tag{4}
\end{equation*}
$$

The dominant pole P 1 is due to $\mathrm{C}_{\text {сомр }}$ :
$f_{P 1}=\frac{G_{\text {EA }}}{2 \pi A_{\text {VEA }} C_{\text {COMP }}}$
The second pole P2 is the output pole:
$f_{P 2}=\frac{I_{\text {OUT }}}{2 \pi V_{\text {OUT }} C_{\text {OUT }}}$
The first zero Z 1 is due to $\mathrm{R}_{\text {сомр }}$ and $\mathrm{C}_{\text {COMP }}$ :
$f_{Z 1}=\frac{1}{2 \pi R_{\text {COMP }} C_{\text {COMP }}}$
And finally, the third pole is due to $\mathrm{R}_{\text {comp }}$ and $\mathrm{C}_{\text {COMP2 }}$ (if $\mathrm{C}_{\text {COMP2 }}$ is used):

$$
\begin{equation*}
f_{P 3}=\frac{1}{2 \pi R_{\text {СОМР }} C_{\text {СОМР2 }}} \tag{8}
\end{equation*}
$$

Follow the following steps to compensate the IC:
STEP 1. Set the cross over frequency at $1 / 10$ of the switching frequency via $\mathrm{R}_{\text {сомр }}$ :

$$
\begin{align*}
& R_{\text {COMP }}=\frac{2 \pi V_{\text {OUT }} C_{\text {OUT }} f_{S W}}{10 G_{\text {EA }} G_{\text {COMP }} 1.222 V}  \tag{9}\\
& =2.3 \times 10^{8} V_{\text {OUT }} C_{\text {OUT }}
\end{align*}
$$

but limit $\mathrm{R}_{\mathrm{COMP}}$ to $15 \mathrm{k} \Omega$ maximum.

STEP 2. Set the zero $f_{Z 1}$ at $1 / 4$ of the cross over frequency. If $R_{\text {Comp }}$ is less than $15 k \Omega$, the equation for $\mathrm{C}_{\text {СомP }}$ is:
$C_{\text {COMP }}=\frac{1.8 \times 10^{-5}}{R_{\text {COMP }}}$
If $R_{\text {Comp }}$ is limited to $15 \mathrm{k} \Omega$, then the actual cross over frequency is $3.4 /\left(\mathrm{V}_{\text {OUT }} \mathrm{C}_{\text {OUT }}\right)$. Therefore:
$C_{\text {COMP }}=1.3 \times 10^{-5} \mathrm{~V}_{\text {OUT }} C_{\text {OUT }}$
STEP 3. If the output capacitor's ESR is high enough to cause a zero at lower than 4 times the cross over frequency, an additional compensation capacitor $\mathrm{C}_{\text {comp2 }}$ is required. The condition for using $\mathrm{C}_{\text {COMP2 }}$ is:

$$
R_{\text {ESROUT }} \geq \operatorname{Min}\left(\frac{1.1 \times 10^{-6}}{C_{\text {OUT }}}, 0.012 \mathrm{~V}_{\text {OUT }}\right)
$$

And the proper value for $\mathrm{C}_{\text {сомP2 }}$ is:

$$
\begin{equation*}
C_{\text {COMP2 }}=\frac{C_{\text {OUT }} R_{\text {ESROUT }}}{R_{\text {COMP }}} \tag{13}
\end{equation*}
$$

A small value $\mathrm{C}_{\text {ComP2 }}$ such as 100 pF may improve stability against PCB layout parasitic effects.
Table 2 shows some calculated results based on the compensation method above.

Table 2:
Typical Compensation for Different Output voltages and Output Capacitors

| $\mathrm{V}_{\text {OUT }}$ | Cout | $\mathbf{R}_{\text {comp }}$ | $\mathrm{C}_{\text {comp }}$ | $\mathrm{C}_{\text {comp2 }}{ }^{\text {® }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 2.5 V | $22 \mu \mathrm{~F}$ Ceramic | 8.2k $\Omega$ | 2.2 nF | 100pF |
| 3.3 V | $22 \mu \mathrm{~F}$ Ceramic | 12k $\Omega$ | 1.5nF | 100pF |
| 5 V | $22 \mu \mathrm{~F}$ Ceramic | $15 \mathrm{k} \Omega$ | 1.5 nF | 100pF |
| 2.5 V | 47 $\mu \mathrm{F}$ SP CAP | 15k $\Omega$ | 1.5 nF | 100pF |
| 3.3 V | 47 $\mu \mathrm{F}$ SP CAP | 15k $\Omega$ | 1.8 nF | 100pF |
| 5 V | 47 $\mu \mathrm{F} \mathrm{SP} \mathrm{CAP}$ | 15k $\Omega$ | 2.7nF | 100pF |
| 2.5 V | $470 \mu \mathrm{~F} / 6.3 \mathrm{~V} / 30 \mathrm{~m} \Omega$ | 15k $\Omega$ | 15nF | 1nF |
| 3.3 V | $470 \mu \mathrm{~F} / 6.3 \mathrm{~V} / 30 \mathrm{~m} \Omega$ | $15 \mathrm{k} \Omega$ | 22nF | 1 nF |
| 5 V | $470 \mu \mathrm{~F} / 6.3 \mathrm{~V} / 30 \mathrm{~m} \Omega$ | $15 \mathrm{k} \Omega$ | 27nF | 1 nF |

(1): $\mathrm{C}_{\text {COMP2 }}$ is needed for board parasitic and high ESR output capacitor.
Figure 3 shows an example ACT4072 application circuit generating a $5 \mathrm{~V} / 2 \mathrm{~A}$ output.

ACT4072

Figure 3:

## ACT4072 5V/2A Output Application ${ }^{\text {® }}$

(1): D1 is a 40V, 3A Schottky diode with low forward voltage, an IR 30BQ040 or SK34 equivalent. C4 can be either a ceramic capacitor (Panasonic ECJ-3YB1C226M) or SP-CAP (Specialty Polymer) Aluminum Electrolytic Capacitor such as Panasonic EEFCD0J470XR. The SP-Cap is based on aluminum electrolytic capacitor technology, but uses a solid polymer electrolyte and has very stable capacitance characteristics in both operating temperature and frequency compared to ceramic, polymer, and low ESR tantalum capacitors.
