

TELEVISION SOUND COMBINATION

The TDA2791 contains the following functions:

- Limiter/amplifier
- F.M. detector.
- Physiological d.c. volume control.
- D.C. tone control.

The limiter/amplifier is designed as a four-stage differential amplifier, to obtain good noise and interference suppression. The detector is a balanced quadrature demodulator.

During VTR operation audio signals can be inserted before the tone and volume control circuits. The limiter amplifier and demodulator must be switched off by grounding pin 2. This switching action occurs without a d.c. shift, so that no transients will be noticed in the speaker. The circuit is very flexible in its application because the characteristics of the various controls can be adapted by changing external component values.
