SPRS148 - AUGUST 2000

- Best Price/Performance Floating-Point Digital Signal Processor (DSP) TMS320C6712
  - 10-ns Instruction Cycle Time
  - 100-MHz Clock Rate
  - Eight 32-Bit Instructions/Cycle
  - 600 MFLOPS
  - C6712 and C6211/C6711 are Pin-Compatible
- VelociTI<sup>™</sup> Advanced Very Long Instruction Word (VLIW) C67x<sup>™</sup> DSP Core
  - Eight Highly Independent Functional Units:
    - Four ALUs (Floating- and Fixed-Point)
    - Two ALUs (Fixed-Point)
    - Two Multipliers (Floating- and Fixed-Point)
  - Load-Store Architecture With 32 32-Bit General-Purpose Registers
  - Instruction Packing Reduces Code Size
  - All Instructions Conditional
- Instruction Set Features
  - Hardware Support for IEEE Single-Precision and Double-Precision Instructions
  - Byte-Addressable (8-, 16-, 32-Bit Data)
  - 8-Bit Overflow Protection
  - Saturation
  - Bit-Field Extract, Set, Clear
  - Bit-Counting
  - Normalization
- L1/L2 Memory Architecture
  - 32K-Bit (4K-Byte) L1P Program Cache (Direct Mapped)
  - 32K-Bit (4K-Byte) L1D Data Cache (2-Way Set-Associative)
  - 512K-Bit (64K-Byte) L2 Unified Mapped RAM/Cache
  - (Flexible Data/Program Allocation)
  - 1024M-Byte Addressable External Memory Space
- Device Configuration
  - Boot Mode: 8- and 16-Bit ROM Boot
  - Endianness: Little Endian, Big Endian

GFN 256-PIN BALL GRID ARRAY (BGA) PACKAGE

(BOTTOM VIEW)

- 16-Bit External Memory Interface (EMIF)
   Glueless Interface to Synchronous Memories: SDRAM and SBSRAM
  - Glueless Interface to Asynchronous Memories: SRAM and EPROM
- Enhanced Direct-Memory-Access (EDMA) Controller
- Two Multichannel Buffered Serial Ports (McBSPs)
  - Direct Interface to T1/E1, MVIP, SCSA Framers
  - ST-Bus-Switching Compatible
  - Up to 256 Channels Each
  - AC97-Compatible
  - Serial-Peripheral-Interface (SPI) Compatible (Motorola<sup>™</sup>)
- Two 32-Bit General-Purpose Timers
- Flexible Phase-Locked-Loop (PLL) Clock Generator
- IEEE-1149.1 (JTAG<sup>†</sup>) Boundary-Scan-Compatible
- 256-Pin Ball Grid Array (BGA) Package (GFN Suffix)
- 0.18-µm/5-Level Metal Process – CMOS Technology
- 3.3-V I/Os, 1.8-V Internal

#### description

The TMS320C67x<sup>™</sup> DSPs (including the TMS320C6712 device) are the floating-point DSP family in the TMS320C6000<sup>™</sup> DSP platform. The TMS320C6712 (C6712) device is based on the high-performance, advanced VelociTI very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications.

With performance of up to 600 million floating-point operations per second (MFLOPS) at a clock rate of 100 MHz, the C6712 device is the lowest-cost DSP in the C6000<sup>™</sup> DSP platform. The C6712 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide four floating-/fixed-point ALUs, two fixed-point ALUs, and two floating-/fixed-point multipliers. The C6712 can produce two multiply-accumulates (MACs) per cycle for a total of 200 million MACs per second (MMACS).

The C6712 uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 32-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 32-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 512-Kbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two.The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, and a glueless 16-bit external memory interface (EMIF) capable of interfacing to SDRAM, SBSRAM, and asynchronous peripherals.

The C6712 has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows<sup>™</sup> debugger interface for visibility into source code execution.

TMS320C67x, TMS320C6000, and C6000 are trademarks of Texas Instruments. Windows is a registered trademark of the Microsoft Corporation.

SPRS148 - AUGUST 2000

#### device characteristics

Table 1 provides an overview of the C6712 DSP. The table shows significant features of the C6712 device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count.

	HARDWARE FEATURES	C6712 (FLOATING-POINT DSP)

#### device compatibility

The TMS320C6712 and C6211/C6711 devices are pin-compatible; thus, making new system designs easier and providing faster time to market. The following list summarizes the device characteristic differences between the C6211, C6711, and C6712 devices:

- The C6211 device has a fixed-point C62x DSP core, while the C6711/C6712 device has a floating-point C67x DSP core.
- The C6211/C6711 device has a 32-bit EMIF, while the C6712 has a 16-bit EMIF.
- The C6211/C6711 device features an HPI, while the C6712 does not.
- The C6712 device has dedicated device configuration pins, BOOTMODE and LENDIAN, that specify the boot-load operation and device endianness, respectively, during reset. On the C6211/C6711 device, these configuration pins are integrated with the HPI pins.
- The 100-MHz C6712 is the lowest-cost entry in the TMS320C6000™ platform.

For a more detailed discussion on the similarities/differences between the C6211, C6711, and C6712 devices, see the *How to Begin Development Today with the TMS320C6211 DSP*, *How to Begin Development Today with the TMS320C6711 DSP*, and *How to Begin Development Today with the TMS320C6712 DSP* application reports (literature number SPRA474, SPRA522, and SPRA693, respectively).

#### functional block and CPU (DSP core) diagram

<sup>†</sup> In addition to fixed-point instructions, these functional units execute floating-point instructions.

#### CPU (DSP core) description

The CPU fetches VelociTI advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C67x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see functional block and CPU (DSP Core) diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

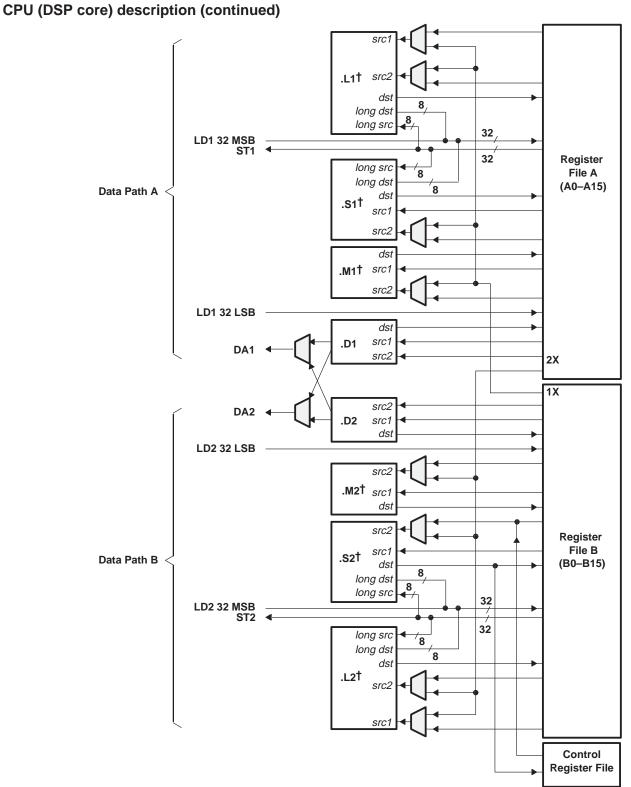

The C67x CPU executes all C62x instructions. In addition to C62x fixed-point instructions, the six out of eight functional units (.L1, .M1, .D1, .D2, .M2, and .L2) also execute floating-point instructions. The remaining two functional units (.S1 and .S2) also execute the new LDDW instruction which loads 64 bits per CPU side for a total of 128 bits per cycle.

Another key feature of the C67x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C67x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically "true"). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are "linked" together by "1" bits in the least significant bit (LSB) position of the instructions. The instructions that are "chained" together for simultaneous execution (up to eight in total) compose an execute packet. A "0" in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

SPRS148 - AUGUST 2000

<sup>†</sup> In addition to fixed-point instructions, these functional units execute floating-point instructions.

#### development support

TI offers an extensive line of development tools for the TMS320C6000<sup>™</sup> DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000-based applications:

#### Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP BIOS), which provides the basic run-time target software needed to support any DSP application.

#### Hardware Development Tools:

Extended Development System (XDS<sup>™</sup>) Emulator (supports C6000<sup>™</sup> DSP multiprocessor system debug) EVM (Evaluation Module)

The *TMS320* DSP Development Support Reference Guide (SPRU011) contains information about development-support products for all TMS320<sup>™</sup> DSP family member devices, including documentation. See this document for further information on TMS320<sup>™</sup> DSP documentation or any TMS320<sup>™</sup> DSP support products from Texas Instruments. An additional document, the *TMS320 Third-Party* Support Reference Guide (SPRU052), contains information about TMS320<sup>™</sup> DSP-related products from other companies in the industry. To receive TMS320<sup>™</sup> DSP literature, contact the Literature Response Center at 800/477-8924.

For a complete listing of development-support tools for the TMS320C6000<sup>™</sup> DSP platform, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL) and under "Development Tools", select "Digital Signal Processors". For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, XDS, C6000, and TMS320 are trademarks of Texas Instruments.

#### device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320<sup>™</sup> DSP devices and support tools. Each TMS320<sup>™</sup> DSP family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- **TMX** Experimental device that is not necessarily representative of the final device's electrical specifications
- **TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- TMS Fully qualified production device

Support tool development evolutionary flow:

- **TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

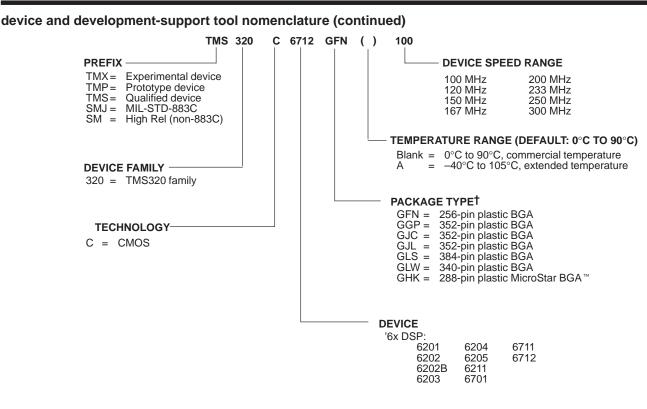

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type, the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -100 is 100 MHz). Figure 4 provides a legend for reading the complete device name for any TMS320C6000<sup>™</sup> DSP family member.

SPRS148 - AUGUST 2000

#### documentation support

Extensive documentation supports all TMS320<sup>™</sup> DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000<sup>™</sup> DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000<sup>™</sup> DSP core (CPU) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190) describes the functionality of the peripherals available on the C6000<sup>™</sup> DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), 32-/16-bit host-port interfaces (HPIs), multichannel buffered serial ports (McBSPs), direct-memory-access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XB), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); and power-down modes. This guide also includes information on internal data and program memories.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the C62x/C67x devices, associated development tools, and third-party support.

The tools support documentation is electronically available within the Code Composer Studio<sup>™</sup> Integrated Development Environment (IDE). For a complete listing of C6000<sup>™</sup> DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at http://www.ti.com uniform resource locator (URL).

See the Worldwide Web URL for the application report *How To Begin Development Today with the TMS320C6712 DSP* (literature number SPRA693), which describes in more detail the compatibility and similarities/differences between the C6711 and C6712 devices.

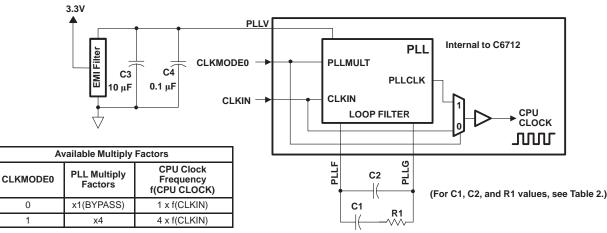

#### SPRS148 - AUGUST 2000

#### clock PLL

All of the internal C6712 clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

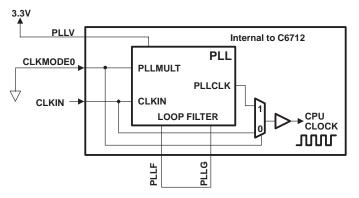

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5 shows the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 6 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C6712 device and the external clock oscillator circuit. Noise coupling into PLLF will directly impact PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

- NOTES: A. Keep the lead length and the number of vias between the PLLF pin, the PLLG pin, and R1, C1, and C2 to a minimum. In addition, place all PLL external components (R1, C1, C2, C3, C4, and the EMI Filter) as close to the C6000<sup>™</sup> DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
  - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI filter).
  - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage,  $DV_{DD}$ .
  - D. EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCCET103U.

#### Figure 5. External PLL Circuitry for Either PLL x4 Mode or x1 (Bypass) Mode

- NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF terminal to the PLLG terminal.
  - B. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.

## Figure 6. External PLL Circuitry for x1 (Bypass) Mode Only

#### clock PLL (continued)

CLKMODE	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 (Ω)	C1 (nF)	C2 (pF)	TYPICAL LOCK TIME (μs)†
x4	16.3–37.5	65–150	32.5–75	60.4	27	560	75

#### Table 2. C6712 PLL Component Selection Table

<sup>†</sup> Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

#### power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

#### system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

#### power-supply design considerations

For systems using the C6000<sup>™</sup> DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, an external clock pulse may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the *Using the TPS56300 to Power DSPs* application report (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000<sup>™</sup> platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

absolute maximum rating	s over operating	a case temperature	range (unless	otherwise noted) <sup>†</sup>
		g eace temperatare	. ange (anneee	

Supply voltage range, CV <sub>DD</sub> (see Note 1)	. $-0.3$ V to 2.3 V
Supply voltage range, DV <sub>DD</sub> (see Note 1)	$\ldots$ –0.3 V to 4 V
Input voltage range	–0.3 V to 4 V
Output voltage range	–0.3 V to 4 V
Operating case temperature range, T <sub>C</sub>	0°C to 90°C
Storage temperature range, T <sub>stg</sub>	. –65°C to 150°C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V<sub>SS</sub>.

#### recommended operating conditions

			MIN	NOM	MAX	UNIT

6	td(EKIL-EKOL)	Delay time, ECLKIN low to ECLKOUT low	1	7	ns

<sup>†</sup> The reference points for the rise and fall transitions are measured at 20% and 80% of  $V_{OH}$ .

‡ E = ECLKIN period in ns

§ EH is the high period of ECLKIN in ns and EL is the low period of ECLKIN in ns.

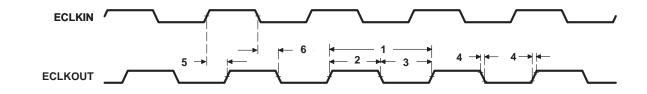

Figure 14. ECLKOUT Timings

## ASYNCHRONOUS MEMORY TIMING

#### timing requirements for asynchronous memory cycles<sup>†‡</sup> (see Figure 15–Figure 16)

			-100		
NO.			MIN	MAX	UNIT
3	<sup>t</sup> su(EDV-AREH)	Setup time, EDx valid before ARE high	13		ns
4	<sup>t</sup> h(AREH-EDV)	Hold time, EDx valid after ARE high	1		ns
6	tsu(ARDY-EKOH)	Setup time, ARDY valid before ECLKOUT high	6		ns
7	<sup>t</sup> h(EKOH-ARDY)	Hold time, ARDY valid after ECLKOUT high	1		ns

<sup>†</sup> To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. The ARDY signal is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of the ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.

‡RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

# switching characteristics over recommended operating conditions for asynchronous memory cycles<sup>द</sup> (see Figure 15–Figure 16)

NO			-100		
NO.		PARAMETER	MIN	UNIT

#### **RESET TIMING**

#### timing requirements for reset<sup>†</sup> (see Figure 28)

				-100		
NO.			MIN	MAX	UNIT	
		Width of the RESET pulse (PLL stable) <sup>‡</sup>	10P		ns	
1	<sup>t</sup> w(RST)	Width of the RESET pulse (PLL needs to sync up)§	250		μs	
14	t <sub>su(BOOT)</sub>	Setup time, BOOTMODE[1:0] configuration bits valid before RESET high	2P		ns	
15	<sup>t</sup> h(BOOT)	Hold time, BOOTMODE[1:0] configuration bits valid after RESET high	2P		ns	

† P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

<sup>‡</sup>This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4 when CLKIN and PLL are stable.

\$ This parameter applies to CLKMODE x4 only (it does not apply to CLKMODE x1). The RESET signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 µs to stabilize following device power up or after PLL configuration has been changed. During that time, RESET must be asserted to ensure proper device operation. See the clock PLL section for PLL lock times.

12	<sup>t</sup> dis(CKXH-DXHZ)	is(CKXH-DXHZ) from CLKX high	CLKX ext	3	9	ns
4.0			CLKX int	-9+ D	4 + D	
13	<sup>t</sup> d(CKXH-DXV)	Delay time, CLKX high to DX valid	CLKX ext	3 + D	19 + D	ns
		Delay time, FSX high to DX valid	FSX int	-1	3	
14	td(FXH-DXV)	ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX ext	3	9	ns

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted. <sup>‡</sup> Minimum delay times also represent minimum output hold times.

P = 1/CPU clock frequency in ns. For example, when running parts at 100 MHz, use P = 10 ns.

The maximum bit rate for McBSP-to-McBSP communications is 25 MHz; therefore, the minimum CLKR/X clock cycle is either four times the CPU cycle time (4P), or 40 ns (25 MHz), whichever value is larger. For example, when running parts at 100 MHz (P = 10 ns), use 40 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). The maximum bit rate for McBSP-to-McBSP communications applies to the following hardware configuration: the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

#C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

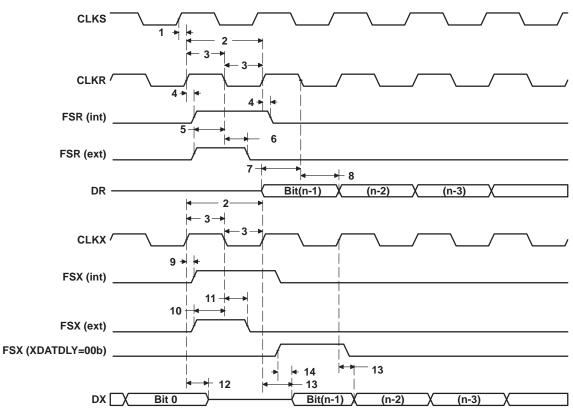

- H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even
  - = (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero
- L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even
  - = (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the 25 MHz limit.

Extra delay from CLKX high to DX valid applies only to the first data bit of a device, if and only if DXENA = 1 in SPCR.

- D = extra delay from CLKX high to DX vaild = 0 if DXENA = 0
  - = extra delay from CLKX high to DX vaild = 2P if DXENA = 1

SPRS148 - AUGUST 2000

GFN (S-PBGA-N256)

#### **MECHANICAL DATA**

#### PLASTIC BALL GRID ARRAY

NOTES: A. All linear dimensions are in millimeters.

B. This drawing is subject to change without notice.

#### thermal resistance characteristics (S-PBGA package)

NO		°C/W	Air Flow LFPM <sup>†</sup>
1	ROJC Junction-to-case	6.4	N/A
2	ROJA Junction-to-free air	25.2	0
3	ROJA Junction-to-free air	23.1	100
4	ROJA Junction-to-free air	21.9	250
5	ROJA Junction-to-free air	20.6	500

<sup>†</sup>LFPM = Linear Feet Per Minute

#### **IMPORTANT NOTICE**

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
