Product Description

Pericom Semiconductor's PI74ALVCH series of logic circuits are produced using the Company's advanced 0.5 micron CMOS technology, achieving industry leading speed.

The PI74ALVCH16260 is a 12-bit to 24-bit multiplexed D-type latch designed for 2.3V to 3.6 V_{CC} operation. It is used in applications where two separate datapaths must be multiplexed onto, or demultiplexed from, a single data path.

Typical applications include multiplexing and/or demultiplexing address and data information in microprocessor or bus-interface and in memory-interleaving.

Three 12-bit I/O ports (A1-A12, 1B1-1B12, and 2B1-2B12) are available for address and/or data transfer. The output-enable ($\overline{OE1B}$, $\overline{OE2B}$, and \overline{OEA}) inputs control bus transceiver functions. The $\overline{OE1B}$ and $\overline{OE2B}$ control signals also allow bank control in the A-to-B direction.

Address and/or data information can be stored using the internal storage latches. The latch-enable ($LE1B$, $LE2B$, $LEA1B$, and $LEA2B$) inputs are used to control data storage. When the latch-enable input is HIGH, the latch is transparent. When the latch-enable input goes LOW, the data present at the inputs is latched and remains latched until the latch-enable input is returned HIGH.

To ensure high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor whose minimum value is determined by the current-sinking capability of the driver.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.
