

16 Channel High Voltage Analog Switch With Bleed Resistors

Features

- HVCMS technology for high performance
- 220V operating conditions
- Output On-resistance typically 22Ω
- Integrated bleed resistors on the outputs
- 5.0V and 12.0V CMOS logic compatibility
- Very low quiescent power dissipation $-10\mu A$
- $-45dB$ min off isolation at 7.5MHz
- Low parasitic capacitance
- Excellent noise immunity
- Flexible operating supply voltages

Applications

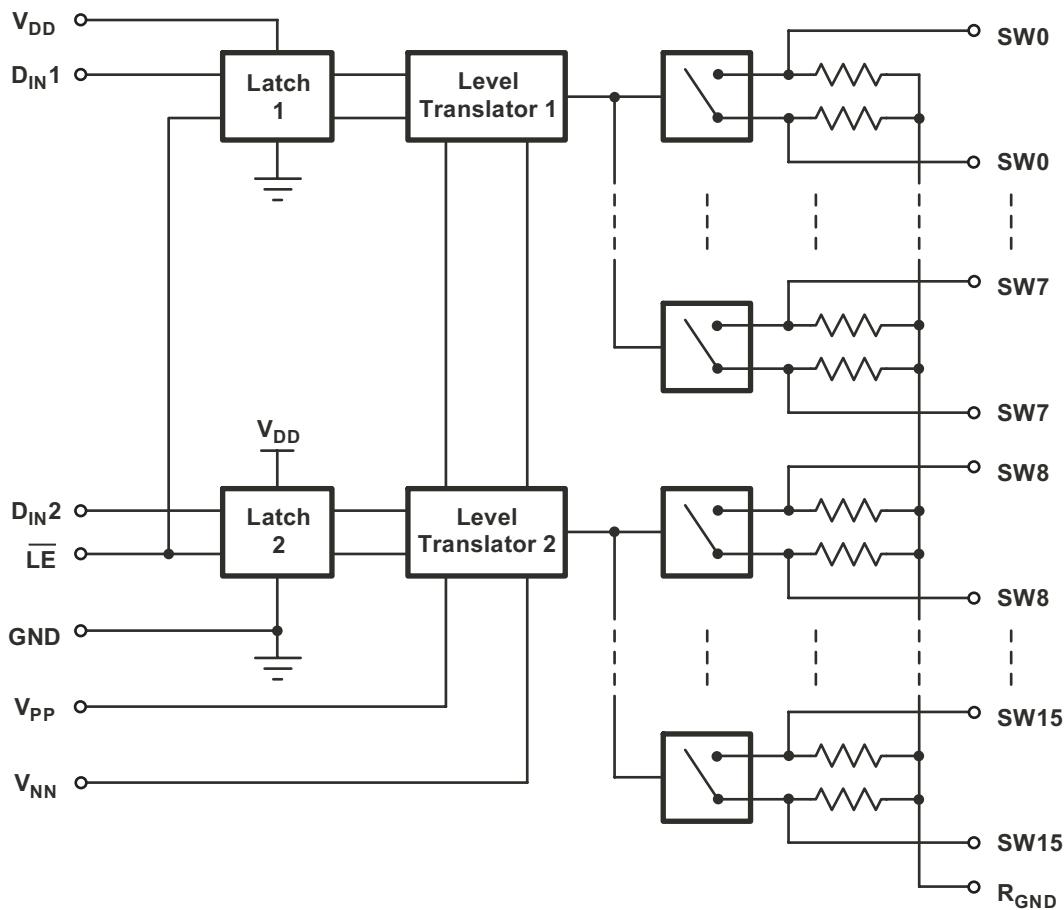

- Medical ultrasound imaging
- Non-destructive evaluation

Description

The Supertex HV238 is a 220V 16-channel high voltage analog switch integrated circuit (IC) with output bleed resistors (R_{INT}). The output switches are configured as 2 sets of 8 single pole single throw analog switches. It is intended to be used in applications requiring high voltage switching controlled by low voltage control signals such as ultrasound imaging.

The 2 sets of 8 analog switches are controlled by 2 input logic controls, D_{IN1} and D_{IN2} . A logic high on D_{IN1} will turn ON switches 0 to 7 and a logic high on D_{IN2} will turn ON switches 8 to 15. The bleed resistors help to significantly reduce voltage built up on capacitive loads such as piezoelectric transducers connected to the outputs.

Block Diagram

Ordering Information

Device	Package Options
	48-lead TQFP
HV238	HV238FG

Absolute Maximum Ratings*

V_{DD} Logic supply	-0.5V to +15V
$V_{PP}-V_{NN}$ differential supply	225V
V_{PP} Positive supply	-0.5V to $V_{NN}+225V$
V_{NN} Negative supply	+0.5V to -225V
Logic input voltage	-0.5V to $V_{DD} +0.3V$
Analog signal range	V_{NN} to V_{PP}
Peak analog signal current/channel	3.0A
Storage temperature	-65°C to 150°C
Power dissipation	48-lead TQFP
	1.0W

*Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability.

Operating Conditions*

Symbol	Parameter	Value
V_{PP}	Positive high voltage supply	50V to 110V
V_{NN}	Negative high voltage supply	-10V to $V_{PP} -220V$
V_{DD}	Logic power supply voltage	4.75V to 12.6V
V_{IH}	High level input voltage	$V_{DD} -1.0V$ to V_{DD}
V_{IL}	Low level input voltage	0V to 1.0V
V_{SIG}	Analog signal voltage peak-to-peak	$V_{NN}+10V$ to $V_{PP}-10V$
T_A	Operating free air temperature	0°C to 70°C

* Notes:

1 Power up/down sequence is arbitrary except GND must be powered-up first and powered-down last.

2 V_{SIG} must be within V_{NN} and V_{PP} or floating during power up/down transition.

3 Rise and fall times of power supplies V_{DD} , V_{PP} , and V_{NN} should not be less than 1.0msec.
