

IL135Z**INTEGRATED CIRCUIT OF TEMPERATURE SENSOR**

(analog LM135Z, SGS-Thomson)

Microcircuit IL135Z is precision temperature sensor with calibration capacity . Microcircuit operates as Zener diode with brake down voltage being in direct proportion to absolute temperature ($10 \text{ mV}^{\circ}\text{K}$). Full dynamic resistance of the circuit is less than 1 Ohm at operation current $450 \mu\text{A} \dots 5 \text{ mA}$. The sensor calibrated at the temperature 25°C , has typical error less than 1°C in the temperature range above 100°C . The peculiarity of the circuit IL135Z is the linear dependence of output voltage versus temperature.

**Packaged IC type:****IC features**

- calibration in $^{\circ}\text{K}$
 - initial measurement accuracy 1°K
 - range of operating supply current from $450 \mu\text{A}$ to 5 mA
- Full dynamic resistance less than 1 Ohm

Table 1 - Maximum ratings

Name of parameter	Symbol	Standard		Unit of measurement
		min	max	
IC current reverse direct	I_R I_F	- --	15 10	mA
Air operation temperature: *	T_{OPER}			°C
- constant mode		- 55	150	
- short-time		150	200	
Storage temperature	T_{stg}	-65	150	°C

Note - * $T_J \leq 150^{\circ}\text{C}$

Table 2 – Temperature parameters.

Name of parameter	Symbol	Standard			Test conditions	Temperature °C	Unit
		min	Type	max			
output voltage, V	U_{OUT}	2,95	2,98	3,01	$I_R = 1 \text{ mA}$	25	V
Non-calibrated temperature error	ΔT_1	-	1 2	3 5	$I_R = 1 \text{ mA}$	25 $-55 \div 150$	°C
temperature error at calibration 25°C	ΔT_2	-	0,5	1,5	$I_R = 1 \text{ mA}$	$-55 \div 150$	°C
Calibrated error in extended temperature range	ΔT_3	-	2	-	$T_{case} = T_{max}$ periodical	$-55 \div 150$	°C
Non-linearity of temperature characteristic	ΔT_4	-	0,3	1	$I_R = 1 \text{ mA}$	$-55 \div 150$	°C

Table 3 – Electrical parameters.

Name of parameter	Symbol	Standard			Test conditions	Temperature °C	
		min	type.	max			
Measurement of output voltage in supply currents range	ΔU_{OUT}	-	2,5	10	$0,45 \text{ mA} \leq I_R \leq 5 \text{ mA}$	$-55 \div 150$	mV
Dynamic impedance	ΔR_1	-	0,5	-	$I_R = 1 \text{ mA}$	25	Ohm
Temperature coefficient of output voltage	TKH	-	+10	-	-	25	$\text{mV}/^{\circ}\text{C}$
Time constant: -still air -speed of air is 0,5 m/c - agitated oil	τ_T	- - -	80 10 1	- - -	-	$-55 \div 150$	C
Time stability	T_{stab}	-	0,2	-	-	125	$^{\circ}\text{C}/1000\text{h}$

Note – Precise measurements done in agitated oil bath. For other conditions there should be taking into consideration self-heating .

Information for application.

There is a simple technique of the device calibration for improving precision of temperature measurement (see typical application circuits).

Calibration of the device occurs in one spot as the IC output voltage is proportional to absolute temperature with sensor voltage extrapolation to 0 V at 0°K (-273,15°C). The errors in dependence of output voltage on temperature are determined only by characteristic incline. Therefore bias calibration at one temperature corrects errors in the whole temperature range. Output voltage of calibrated or non calibrated circuit may be derived from the following equation:

$$V_{OT} = V_{OT_0} \frac{T}{T_0};$$

where T – unknown temperature;

T₀ – reference temperature (in °K).

Nominally IC output calibrated to the value 10 mV/°K.

BELMICROSYSTEMS

IL135Z

To ensure measurement precision they apply some rules. Degradation of the precision when self-heating is proper to any devices of temperature sensors. The circuit should operate at low operating current but sufficient for controlling the sensor and its calibration circuit at maximum operating temperature.

When using the sensor in the field with constant thermal resistance, error when self-heating may be reduced by external calibration. It can be done at the circuit bias when applying temperature-stabilized current. Thus heating will be proportional to Zener diode voltage. In this case error when self-heating is proportional to absolute temperature as the error of scaling coefficient.

Typical application circuits.
