## One-time PROM built-in 8-bit Single Chip Microcontroller

### Preliminary

### Overview

The LC86P4564 is a CMOS 8-bit single chip microcontroller with One-time PROM for the LC864500 series.

This microcontroller has the function and the pin assignment identical to those of the LC864500 series mask ROM version, and has the built-in 64K-byte PROM.

### Package Dimensions

unit : mm

#### 3128-DIP52S

### Features

- (1) Options switchable by PROM data

The option functions of the LC864500 series can be specified by the PROM data. The functions of the trial pieces can be evaluated using mass production board.

- (2) Internal PROM capacity : 65512 bytes (For program)  
8192 × 12 bits (For character)

- (3) Internal RAM capacity : 256 bytes

The LC86P4564 contains a 65512-byte PROM and a 256-byte RAM. Each size is the maximum capacity of the LC86P4564 mask-ROM series.

Mask ROM version	PROM capacity	RAM capacity
LC864532	32768 bytes	256 bytes
LC864528	28672 bytes	256 bytes
LC864524	24576 bytes	256 bytes
LC864520	20480 bytes	256 bytes
LC864516	16384 bytes	256 bytes
LC864512	12288 bytes	256 bytes
LC864508	8192 bytes	256 bytes

- (4) Operating supply voltage : 4.5 V to 5.5 V  
 (5) Instruction cycle time : 1.0 μs to 366 μs  
 (6) Operating temperature : -30°C to +70°C  
 (7) The pin and the package compatible with the LC864500 series mask ROM version  
 (8) Applicable mask ROM version : LC864532/LC864528/LC864524/LC864520/LC864516/LC864512/LC864508  
 (9) Factory shipment : DIP52S

## LC86P4564

### Usage Notes

When using, take note of the followings.

(1) Differences between the LC86P4564 and the LC864500 series

Item	LC86P4564	LC864532/28/24/20/16/12/08
Operation after reset releasing	The option must be set internally within 3 ms after a high-level signal is applied to the reset terminal. In this period options are switched gradually, and after that, the program is executed from 00H of the program counter.	The program is executed from 00H of the program counter as soon as a high-level signal is applied to the reset terminal.
Operating supply voltage range (V <sub>DD</sub> )	4.5 V to 5.5 V	2.5 V to 6.0 V
Current drain under normal operation	Refer to 'electrical characteristics' on the semiconductor news.	

Port format of the LC86P4564 during the reset is identical to that of the LC864532/28/24/20/16/12/08.

The LC86P4564 uses 256-byte spaces addressed 0FF00H to 0FFFFH in the program memory to set options. In this way, all options of the LC864500 series cannot be executed.

Some of the LC864500 series options, which the LC86P4564 can support are as shown in the table below.

• LC86P4564 options

Option types	Pins, circuits	Contents of the option
Input/output specifications of input/output ports	Port 0	1. N-channel open-drain output 2. CMOS output *1
		1. Pull-up MOS transistor provided 2. Pull-up MOS transistor not provided *2
Pull-up MOS transistor of input port.	Port 1 *1	1. Input : Programmable pull-up MOS transistor Output : N-channel open drain 2. Input : Programmable pull-up MOS transistor Output : CMOS
	Port 7 *1	1. Pull-up MOS transistor not provided. 2. Pull-up MOS transistor provided.

\*1) Specified in bit units

\*2) When the "CMOS output" is selected as an output format, the pull-up MOS transistor will be provided, and when the "n-channel open-drain output" is selected, the pull-up MOS transistor will not be provided.

(2) Option setting program

The option data is written with the option specifying program "SU86K.EXE". The option data is linked to the program area by the linkage loader "L86K.EXE".

## LC86P4564

(3) ROM space

The LC86P4564 and LC864500 series use 256 bytes addressed on 0FF00H to 0FFFFH in the program memory as the option specified data area. The program memory capacity of the series is 65280 bytes addressed on 0000H to 0FEFFH. Note that the capacity of the LC86P4564 user-available PROM is 32768 bytes addressed on 0000H to 7FFFH, because the maximum ROM capacity of the LC864500 series ROM version is 32 K byte.

## How to Use

(1) Create a programming data for LC86P4564

Programming data for PROM of the LC86P4564 is required.

Debugged evaluation file (EVA file) must be converted to an INTEL-HEX formatted file (HEX file) with file converter program EVA2HEX.EXE. The HEX file is used as the programming data for the LC86P4564.

(2) How to program for the PROM

The LC86P4564 can be programmed by the general purpose EPROM programmer with an attachment ; W86EP4564D.

- Recommended EPROM programmers are as shown in the table below.

Manufacturer	EPROM programmer
Advantest	R4945, R4944
Andou	AF-9704
AVAL	PKW-1100, PKW-3000
Minato electronics	MODEL1890A

- The "27010 (Vp-p = 12.5 V) Intel high speed programming" mode requires to be used for writing. The storage area addressed "0 to 13FFFH" requires to be selected for address setting and the jumper (DASEC) must be set to 'OFF' at programming.

(3) How to use the data security function

"Data security" is the function to prevent the EPROM data from being read out.

The following is the process in order to execute the data security.

1. Set the jumper of attachment 'ON'.
2. Program again. The EPROM programmer will display an error. The error indication means normal activity of the data security. It does not mean a trouble of the EPROM programmer or the LSI.

Notes

- Data security is not executed when the data of all address have 'FF' at sequence 2 above.
- Data security cannot be executed by programming the sequential operation "BLANK=>PROGRAM=>VERIFY" at sequence 2 above.
- Set the jumper 'OFF' after executing the data security.

(Note 1) Refer to Table 1 and Table 2 for the oscillation constant.

(Note 2) The oscillation stable time is a period necessary for the oscillation to be stable after the power first applied, the HOLD mode released and the main-clock oscillation stop instruction released.  
Refer to the Figure 3 for details.

### 7. D/A Converter Characteristics at Ta = -30°C to +70°C, V<sub>SS</sub> = 0 V

Parameter	Symbol	Pins	Conditions	Ratings			Unit
				V <sub>DD</sub> [V]	min	typ	
Resolution	NDA			4.5 to 5.5		7	bit
Absolute precision	ETDA		7 bits mode (Note 4)	4.5 to 5.5		±2.0	LSB
Settling time	tSDA		(Note 5)	4.5 to 5.5		1.0	μs
Analog input voltage range	V <sub>AOUT</sub>	DA0 to DA1		4.5 to 5.5	V <sub>SS</sub>		V <sub>DD</sub> V
Output resistor	RODA		(Note 6)	4.5 to 5.5		8	kΩ

Note 4 : The ±1/2-LSB quantization error is not included. (No load.)

Note 5 : Settling time refers to the time from when the D/A conversion instruction is executed to when the analog voltage output corresponding to the digital voltage on the specific port is generated.

Note 6 : D/A data = 80H

### 8. Current Drain Characteristics at Ta = -30°C to +20°C, V<sub>SS</sub> = 0 V

- (Notes)
- Since the circuit pattern affects the oscillation frequency, place the oscillation-related parts as close to the oscillation pins as possible with the shortest possible pattern length.
  - If you use other oscillators herein, we provide no guarantee for the characteristics.
  - Adjust the voltage of monitor point in Figure 10 to  $1/2V_{\text{DD}} \pm 10\%$  by the LC oscillation constant 'L' or 'C' to lock the PLL circuit.
