MOS INTEGRATED CIRCUIT

MC-4R128FKE6D-840

Direct Rambus DRAM RIMM^{TM} Module
128M-BYTE (64M-WORD x 16-BIT)

Description

The Direct Rambus RIMM module is a general-purpose high-performance memory module subsystem suitable for use in a broad range of applications including computer memory, personal computers, workstations, and other applications where high bandwidth and low latency are required.

MC-4R128FKE6D modules consists of four 288M Direct Rambus DRAM (Direct RDRAM) devices (μPD488588). These are extremely high-speed CMOS DRAMs organized as 16M words by 18 bits. The use of Rambus Signaling Level (RSL) technology permits 600MHz, 711MHz or 800MHz transfer rates while using conventional system and board design technologies.

Direct RDRAM devices are capable of sustained data transfers at 1.25 ns per two bytes (10 ns per sixteen bytes).

The architecture of the Direct RDRAM enables the highest sustained bandwidth for multiple, simultaneous, randomly addressed memory transactions. The separate control and data buses with independent row and column control yield over 95 % bus efficiency. The Direct RDRAM's 32 banks support up to four simultaneous transactions per device.
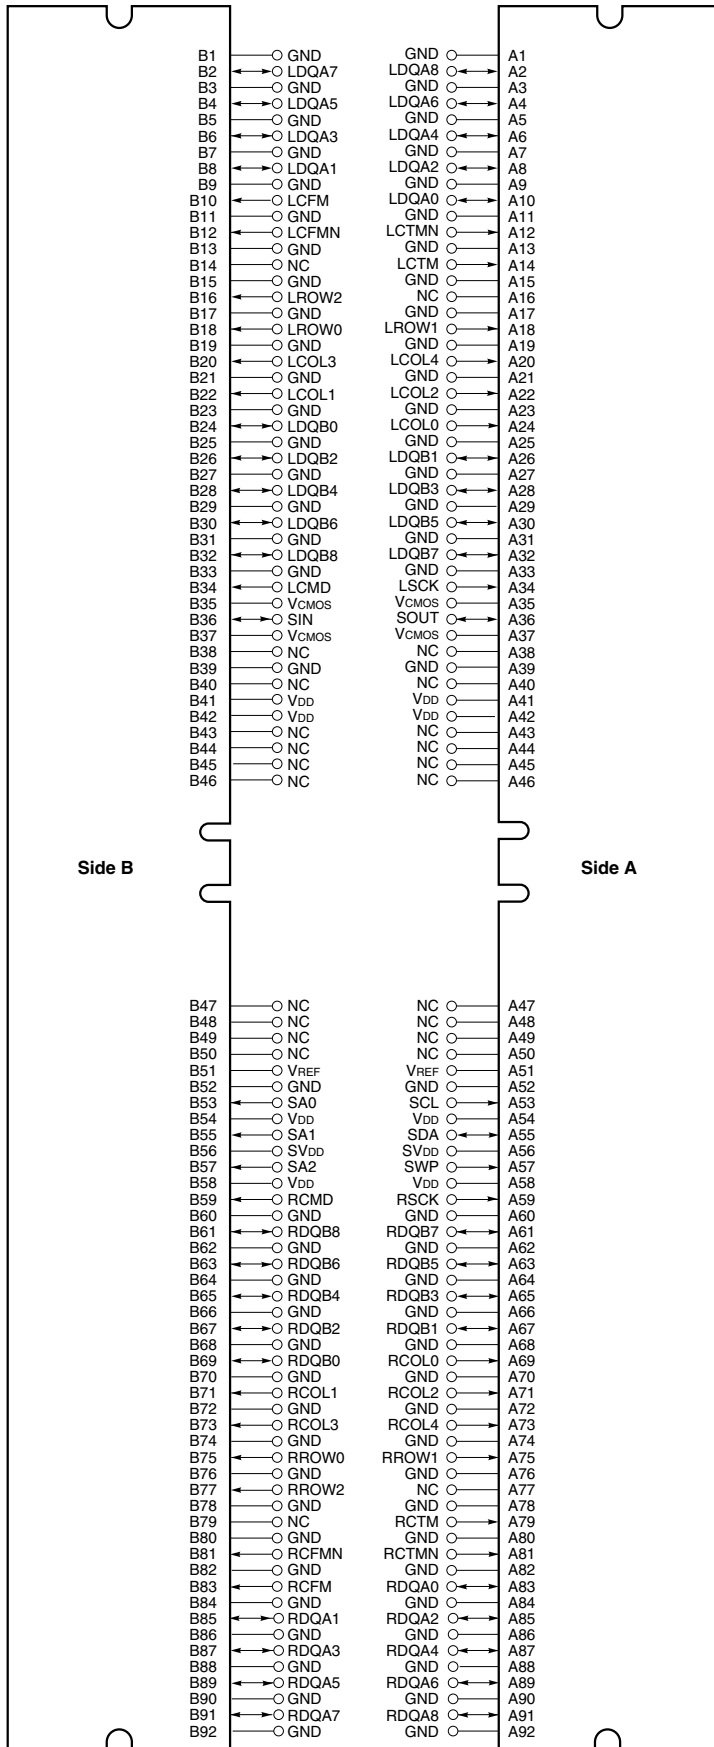

Features

- 184 edge connector pads with 1mm pad spacing
- 128 MB Direct RDRAM storage
- Each RDRAM$^{\circledR}$ has 32 banks, for 128 banks total on module
- Gold plated contacts
- RDRAMs use Chip Scale Package (CSP)
- Serial Presence Detect support
- Operates from a 2.5 V supply
- Powerdown self refresh modes
- Separate Row and Column buses for higher efficiency
- Over Drive Factor (ODF) support

Module Connector Pad Description   (1/2)

Signal	I/O	Type	Description
GND	–	–	Ground reference for RDRAM core and interface. 72 PCB connector pads.
LCFM	I	RSL	Clock from master. Interface clock used for receiving RSL signals from the Channel. Positive polarity.
LCFMN	I	RSL	Clock from master. Interface clock used for receiving RSL signals from the Channel. Negative polarity.
LCMD	I	V_{CMOS}	Serial Command used to read from and write to the control registers. Also used for power management.
LCOL4..LCOL0	I	RSL	Column bus. 5-bit bus containing control and address information for column accesses.
LCTM	I	RSL	Clock to master. Interface clock used for transmitting RSL signals to the Channel. Positive polarity.
LCTMN	I	RSL	Clock to master. Interface clock used for transmitting RSL signals to the Channel. Negative polarity.
LDQA8..LDQA0	I/O	RSL	Data bus A. A 9-bit bus carrying a byte of read or write data between the Channel and the RDRAM. LDQA8 is non-functional on modules with x16 RDRAM devices.
LDQB8..LDQB0	I/O	RSL	Data bus B. A 9-bit bus carrying a byte of read or write data between the Channel and the RDRAM. LDQB8 is non-functional on modules with x16 RDRAM devices.
LROW2..LROW0	I	RSL	Row bus. 3-bit bus containing control and address information for row accesses.
LSCK	I	V_{CMOS}	Serial clock input. Clock source used to read from and write to the RDRAM control registers.
NC	–	–	These pads are not connected. These 24 connector pads are reserved for future use.
RCFM	I	RSL	Clock from master. Interface clock used for receiving RSL signals from the Channel. Positive polarity.
RCFMN	I	RSL	Clock from master. Interface clock used for receiving RSL signals from the Channel. Negative polarity.
RCMD	I	V_{CMOS}	Serial Command Input used to read from and write to the control registers. Also used for power management.
RCOL4..RCOL0	I	RSL	Column bus. 5-bit bus containing control and address information for column accesses.
RCTM	I	RSL	Clock to master. Interface clock used for transmitting RSL signals to the Channel. Positive polarity.
RCTMN	I	RSL	Clock to master. Interface clock used for transmitting RSL signals to the Channel. Negative polarity.
RDQA8..RDQA0	I/O	RSL	Data bus A. A 9-bit bus carrying a byte of read or write data between the Channel and the RDRAM. RDQA8 is non-functional on modules with x16 RDRAM devices.
RDQB8..RDQB0	I/O	RSL	Data bus B. A 9-bit bus carrying a byte of read or write data between the Channel and the RDRAM. RDQB8 is non-functional on modules with x16 RDRAM devices.
RROW2..RROW0	I	RSL	Row bus. 3-bit bus containing control and address information for row accesses.

(2/2)

Signal	I/O	Type	Description
RSCK	I	V_{CMOS}	Serial clock input. Clock source used to read from and write to the RDRAM control registers.
SA0	I	SV_{DD}	Serial Presence Detect Address 0.
SA1	I	SV_{DD}	Serial Presence Detect Address 1.
SA2	I	SV_{DD}	Serial Presence Detect Address 2.
SCL	I	SV_{DD}	Serial Presence Detect Clock.
SDA	I/O	SV_{DD}	Serial Presence Detect Data (Open Collector I/O).
SIN	I/O	V_{CMOS}	Serial I/O for reading from and writing to the control registers. Attaches to SIO0 of the first RDRAM on the module.
SOUT	I/O	V_{CMOS}	Serial I/O for reading from and writing to the control registers. Attaches to SIO1 of the last RDRAM on the module.
SV_{DD}	—	—	SPD Voltage. Used for signals SCL, SDA, SWP, SA0, SA1 and SA2.
SWP	I	SV_{DD}	Serial Presence Detect Write Protect (active high). When low, the SPD can be written as well as read.
V_{CMOS}	—	—	CMOS I/O Voltage. Used for signals CMD, SCK, SIN, SOUT.
V_{DD}	—	—	Supply voltage for the RDRAM core and interface logic.
V_{REF}	—	—	Logic threshold reference voltage for RSL signals.

Block Diagram
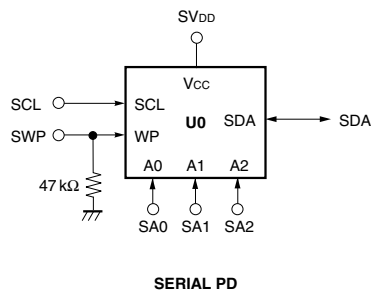

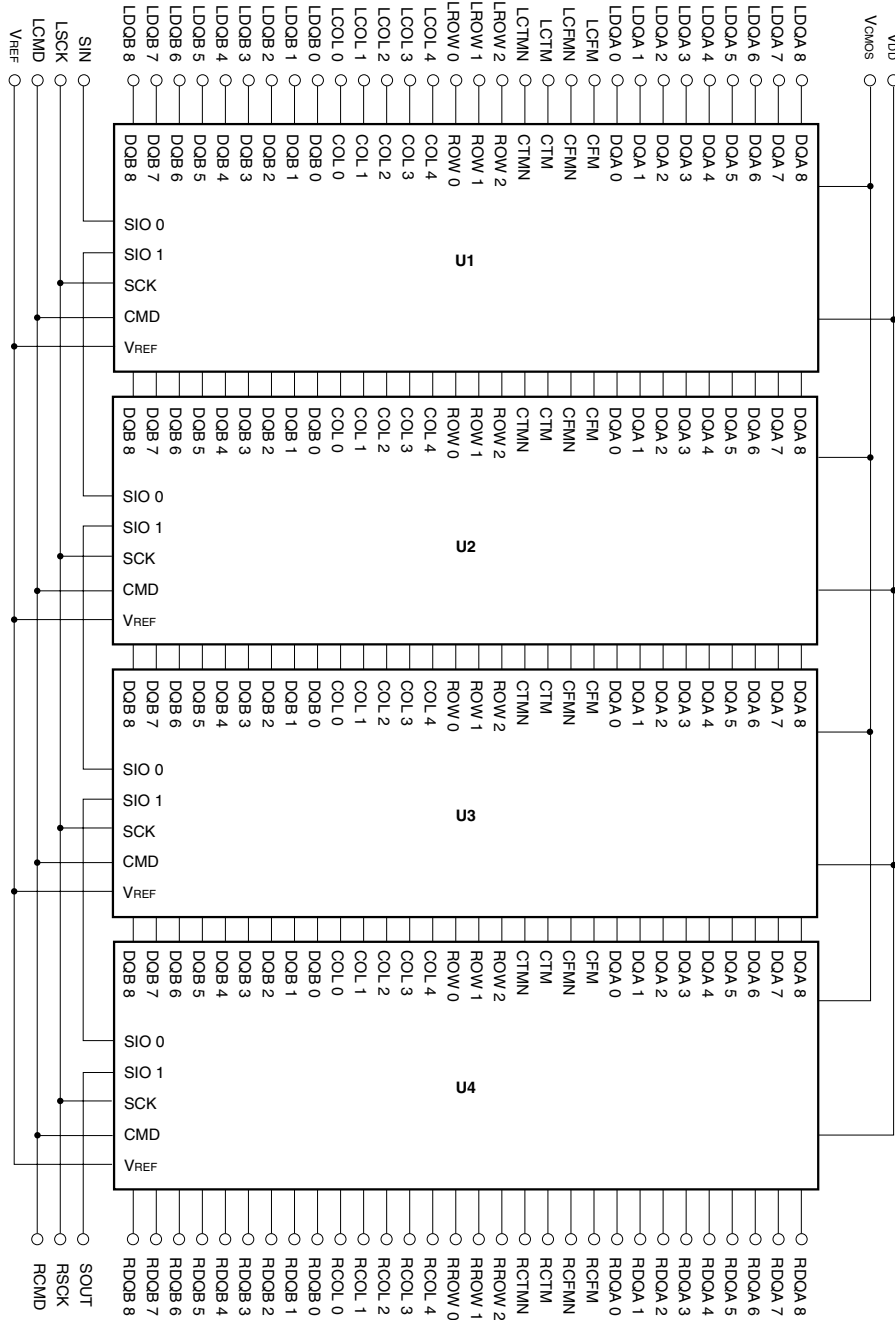

SERIAL PD

Remarks 1. Rambus Channel signals form a loop through the RIMM module, with the exception of the SIO chain.

2. See Serial Presence Detection Specification for information on the SPD device and its contents.

Electrical Specification

Absolute Maximum Ratings

Symbol	Parameter	MIN.	MAX.	Unit
$V_{I,ABS}$	Voltage applied to any RSL or CMOS signal pad with respect to GND	−0.3	V_{DD} + 0.3	V
$V_{DD,ABS}$	Voltage on V_{DD} with respect to GND	−0.5	V_{DD} + 1.0	V
T_{STORE}	Storage temperature	−50	+100	°C

Caution **Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.**

DC Recommended Electrical Conditions

Symbol	Parameter and conditions		MIN.	MAX.	Unit
V_{DD}	Supply voltage		2.50 − 0.13	2.50 + 0.13	V
V_{CMOS}	CMOS I/O power supply at pad	2.5V controllers	2.5 − 0.13	2.5 + 0.25	V
		1.8V controllers	1.8 − 0.1	1.8 + 0.2	
V_{REF}	Reference voltage		1.4 − 0.2	1.4 + 0.2	V
V_{IL}	RSL input low voltage		V_{REF} − 0.5	V_{REF} − 0.2	V
V_{IH}	RSL input high voltage		V_{REF} + 0.2	V_{REF} + 0.5	V
$V_{IL,CMOS}$	CMOS input low voltage		−0.3	$0.5V_{CMOS}$ − 0.25	V
$V_{IH,CMOS}$	CMOS input high voltage		$0.5V_{CMOS}$+0.25	V_{CMOS} + 0.3	V
$V_{OL,CMOS}$	CMOS output low voltage, $I_{OL,CMOS}$ = 1 mA		—	0.3	V
$V_{OH,CMOS}$	CMOS output high voltage, $I_{OH,CMOS}$ = −0.25 mA		V_{CMOS} − 0.3	—	V
I_{REF}	V_{REF} current, $V_{REF,MAX}$		−40.0	+40.0	μA
$I_{SCK,CMD}$	CMOS input leakage current, ($0 \leq V_{CMOS} \leq V_{DD}$)		−40.0	+40.0	μA
$I_{SIN,SOUT}$	CMOS input leakage current, ($0 \leq V_{CMOS} \leq V_{DD}$)		−10.0	+10.0	μA

AC Electrical Specifications

Symbol	Parameter and Conditions	MIN.	TYP.	MAX.	Unit
Z	Module Impedance of RSL signals	25.2	28.0	30.8	Ω
	Module Impedance of SCK and CMD signals	23.8	28.0	32.2	
T_{PD}	Average clock delay from finger to finger of all RSL clock nets (CTM, CTMN,CFM, and CFMN)			1.28	ns
ΔT_{PD}	Propagation delay variation of RSL signals with respect to TPD [Note1,2]	−21		+21	ps
$\Delta T_{PD\text{-}CMOS}$	Propagation delay variation of SCK signal with respect to an average clock delay [Note1]	−250		+250	ps
$\Delta T_{PD\text{-}SCK,CMD}$	Propagation delay variation of CMD signal with respect to SCK signal	−200		+200	ps
V_α/V_{IN}	Attenuation Limit			12.0	%
V_{XF}/V_{IN}	Forward crosstalk coefficient (300ps input rise time 20% - 80%)			2.0	%
V_{XB}/V_{IN}	Backward crosstalk coefficient (300ps input rise time 20% - 80%)			1.5	%
R_{DC}	DC Resistance Limit			0.6	Ω

Notes 1. T_{PD} or Average clock delay is defined as the average delay from finger to finger of all RSL clock nets (CTM, CTMN, CFM, and CFMN).

2. If the RIMM module meets the following specification, then it is compliant to the specification.
If the RIMM module does not meet these specifications, then the specification can be adjusted by the "Adjusted ΔT_{PD} Specification" table.

Adjusted ΔT_{PD} Specification

Symbol	Parameter and conditions	Adjusted MIN./MAX.	Absolute MIN.	Absolute MAX.	Unit
ΔT_{PD}	Propagation delay variation of RSL signals with respect to T_{PD}	+/− [17+(18*N*ΔZ0)] [Note]	−30	+30	ps

Note N = Number of RDRAM devices installed on the RIMM module.

ΔZ0 = delta Z0% = (MAX. Z0 − MIN. Z0) / (MIN. Z0)

(MAX. Z0 and MIN. Z0 are obtained from the loaded (high impedance) impedance coupons of all RSL layers on the module.)

RIMM Module Current Profile

I_{DD}	RIMM module power conditions [Note1]	MAX.	Unit
I_{DD1}	One RDRAM in Read [Note2], balance in NAP mode	717.6	mA
I_{DD2}	One RDRAM in Read [Note2], balance in Standby mode	975	mA
I_{DD3}	One RDRAM in Read [Note2], balance in Active mode	1110	mA
I_{DD4}	One RDRAM in Write, balance in NAP mode	777.6	mA
I_{DD5}	One RDRAM in Write, balance in Standby mode	1035	mA
I_{DD6}	One RDRAM in Write, balance in Active mode	1170	mA

Notes 1. Actual power will depend on individual RDRAM component specifications, memory controller and usage patterns. Power does not include Refresh Current.

2. I/O current is a function of the % of 1's, to add I/O power for 50 % 1's for a x16 need to add 257 mA or 290 mA for x18 ECC module for the following : V_{DD} = 2.5 V, V_{TERM} = 1.8 V, V_{REF} = 1.4 V and V_{DIL} = V_{REF} − 0.5 V.

CAUTION FOR HANDLING MEMORY MODULES

When handling or inserting memory modules, be sure not to touch any components on the modules, such as the memory ICs, chip capacitors and chip resistors. It is necessary to avoid undue mechanical stress on these components to prevent damaging them.
In particular, do not push module cover or drop the modules in order to protect from mechanical defects, which would be electrical defects.

When re-packing memory modules, be sure the modules are not touching each other.
Modules in contact with other modules may cause excessive mechanical stress, which may damage the modules.

MDE0202

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR MOS DEVICES

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.
