MSM54V32126A

131,072-Word × 32-Bit DYNAMIC RAM : FAST PAGE MODE TYPE WITH EDO

DESCRIPTION

The MSM54V32126A is a Graphics DRAM organized in a 131,072-word × 32-bit configuration. The technology used to fabricate the MSM54V32126A is OKI's CMOS silicon gate process technology. The device operates with a single 3.3 V power supply.

FEATURES

- 131,072-word × 32-bit organization
- Single 3.3 V power supply, ±0.3 V tolerance
- Refresh: 512 cycles/8 ms
- Fast Page Mode with Extended Data Out (EDO)
- Byte write, Byte read
- $\overline{\text{RAS}}$ only refresh
- $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh
- $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ self-refresh
- Hidden refresh
- Package options:
 64-pin 525 mil plastic SSOP (SSOP64-P-525-0.80-K) (Product : MSM54V32126A-xxGS-K)
 70/64-pin 400 mil plastic TSOP (Type II)(TSOPII70/64-P-400-0.65-K)(Product : MSM54V32126A-xxTS-K)
 xx indicates speed rank.

- Notes:
1. An initial pause of 200 μ s is required after power-up followed by any 8 $\overline{\text{RAS}}$ cycles (Example : $\overline{\text{RAS}}$ only refresh) before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ cycles instead of 8 $\overline{\text{RAS}}$ cycles are required.
 2. The AC characteristics assume at $t_T = 3$ ns.
 3. V_{IH} (Min.) and V_{IL} (Max.) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} . Input levels at the AC testing are 3.0 V/0 V.
 4. Data outputs are measured with a load of 30 pF.
DOUT reference levels : $V_{OH}/V_{OL} = 2.0$ V/0.8 V.
 5. t_{REZ} (Max.), t_{CEZ} (Max.), t_{WEZ} (Max.) and t_{OEZ} (Max.) define the time at which the outputs achieve the open circuit condition and are not referenced to output voltage levels. This parameter is sampled and not 100% tested.
 6. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
 7. These parameters are referenced to $\overline{\text{CAS}}$ leading edge of early write cycles and to $\overline{\text{WE}}$ leading edge in $\overline{\text{OE}}$ controlled write cycles and read modify write cycles.
 8. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$ (Min.), the cycle is an early write cycle and the data out pin will remain open circuit throughout the entire cycle; If $t_{RWD} \geq t_{RWD}$ (Min.), $t_{CWD} \geq t_{CWD}$ (Min.) and $t_{AWD} \geq t_{AWD}$ (Min.), the cycle is a read modify write cycle and the data out will contain data read from the selected cell: If neither of the above sets of conditions is satisfied, the condition of the data out is indeterminate.
 9. Operation within the t_{RCD} (Max.) limit ensures that t_{RAC} (Max.) can be met.
 t_{RCD} (Max.) is specified as a reference point only: If t_{RCD} is greater than the specified t_{RCD} (Max.) limit, then access time is controlled by t_{CAC} .
 10. Operation within the t_{RAD} (Max.) limit ensures that t_{RAC} (Max.) can be met. t_{RAD} (Max.) is specified as a reference point only: If t_{RAD} is greater than the specified t_{RAD} (Max.) limit, then access time is controlled by t_{AA} .
 11. This is guaranteed by design. ($t_{DOH} = t_{CAC}$ - output transition time) This parameter is not 100% tested.
 12. These parameters are determined by the earliest falling edge of $\overline{\text{CAS1}}$, $\overline{\text{CAS2}}$, $\overline{\text{CAS3}}$, or $\overline{\text{CAS4}}$.
 13. These parameters are determined by the latest rising edge of $\overline{\text{CAS1}}$, $\overline{\text{CAS2}}$, $\overline{\text{CAS3}}$, or $\overline{\text{CAS4}}$.
 14. t_{CWL} should be satisfied by all $\overline{\text{CAS}}$ es.
 15. t_{CP} and t_{CPT} are determined by the time that all $\overline{\text{CAS}}$ es are high.
