Derating Graph and Pinning

External capacitance:

These converters will work without external capacitors but they are necessary in order to guarantee the full line load range. All parts have been tested using the following recommended values.

Pin 8 (CS)

This pin provides a connection point to the main reservoir capacitor. Additional capacitance can be added from this to pin 7. Any low ESR capacitor will improve ripple and noise in some measure. Starting values can be in the range of 100uF.

Pin 3 (CTRL)

Control pin (ON/OFF)
 Output starts at low or open and stops when high. Voltage applied via a limiting resistor and switching diode. The converter is in a low power mode during the high level phase.

Connection example

Pin 5 (NE)

This pin is used internally and must have no external connection.

Application Notes

Pin 3: The outside control connection. This pin provides the converter output ON/OFF, and the control common is referred to negative input.

Pin 5: This pin belongs to the secondary side. It just avoids someone to reverse the primary and secondary.

Pin 8: Max. 1000 uF
