

Product Description

Sirenza Microdevices' **SLD-1000** is a robust 4 Watt high performance LDMOS transistor die, designed for operation from 10 to 2700MHz. It is an excellent solution for applications requiring high linearity and efficiency. The SLD-1000 is typically used as a driver or output stage for power amplifier, or transmitter applications. These robust power transistors are fabricated using Sirenza's high performance XEMOS II™ process.

Pad Diagram

Note 1:

Gate voltage must be applied to the device concurrently or after application of drain voltage to prevent potentially destructive oscillations. Bias voltages should never be applied to the transistor unless it is properly terminated on both input and output.

Note 2:

The required V_{GS} corresponding to a specific I_{DQ} will vary from device to device due to the normal die-to-die variation in threshold voltage with LDMOS transistors.

Note 3:

The threshold voltage (V_{GSTH}) of LDMOS transistors varies with device temperature. External temperature compensation may be required. See Sirenza application notes AN-067 LDMOS Bias Temperature Compensation.

Absolute Maximum Ratings

Parameters	Value	Unit
Drain Voltage (V_{DS})	35	Volts
Gate Voltage (V_{GS}), $V_{DS} = 0$	20	Volts
RF Input Power	+30	dBm
Load Impedance for Continuous Operation Without Damage	10:1	VSWR
Output Device Channel Temperature	+200	°C
Storage Temperature Range	-40 to +150	°C

Operation of this device beyond any one of these limits may cause permanent damage. For reliable continuous operation see typical setup values specified in the table on page one.

Caution: ESD Sensitive

Appropriate precaution in handling, packaging and testing devices must be observed.
