

## OVERVIEW

The SM5009 series are crystal oscillator module ICs that incorporate low crystal current type oscillating circuit to limit oscillator-stage current, so that they can reduce crystal current lower than the existing products. Since the oscillating circuit has oscillator capacitors with excellent frequency response and feedback resistor built-in, just connecting crystal realizes stable fundamental oscillation responding up to 40MHz. The SM5009 series are ideal for SMD type crystal oscillator using a strip-shaped crystal blank.

## FEATURES

- Low crystal current oscillator
- Up to 40MHz operating frequency range (fundamental oscillation)
- Operating supply voltage range
  - 3V operation: 2.7 to 3.6V
  - 5V operation: 4.5 to 5.5V
- -40 to 85°C operating temperature range
- Oscillation capacitors  $C_G$ ,  $C_D$  built-in
- Inverter amplifier feedback resistor built-in
- Standby function
  - Oscillator stops (AL series), high impedance in standby mode
- Low standby current
- Power-save pull-up resistor built-in (AL series)
- Frequency divider built-in ( $f_O$ ,  $f_O/2$ ,  $f_O/4$ ,  $f_O/8$ ,  $f_O/16$ ,  $f_O/32$  determined by internal connection)
- Output drive capability
  - AL×, AN×, AK×, CN×: 16mA ( $V_{DD} = 4.5V$ )
  - AH×: 4mA ( $V_{DD} = 4.5V$ )
- Output load:  $C_L = 50pF$  max.
- Output duty level
  - CMOS level ( $1/2 V_{DD}$ ): AL×, AN×, AH×, CN×
  - TTL level (1.4V): AK×
- Molybdenum-gate CMOS process
- 8-pin SOP (SM5009×××S)
- Chip form (CF5009×××)

1. Package devices (8-pin SOP) have designation SM5009×××S.

2. The recommended operating frequency is a yardstick value derived from the crystal used for NPC characteristics authentication. However, the oscillator frequency band is not guaranteed. Specifically, the characteristics can vary greatly due to crystal characteristics and mounting conditions, so the oscillation characteristics of components must be carefully evaluated.

3. Output load value is the maximum load capacitance that allows drive.

## BLOCK DIAGRAM

Notes. The SM5009 series reduce crystal current by limiting driving current of oscillating-stage inverter and inhibiting oscillating amplitude. Depending on the characteristics of using crystal or the mounting condition, they may not oscillate normally. Please evaluate the oscillation start-up characteristics adequately with your actual device.

## FUNCTIONAL DESCRIPTION

### Standby Function

#### 5009 AL× series

When  $\overline{\text{INH}}$  goes LOW, the oscillator stops and the oscillator output on Q becomes high impedance.

#### 5009AH×, AK×, AN×, CN× series

When  $\overline{\text{INH}}$  goes LOW, the output on Q becomes high impedance, but internally the oscillator does not stop.

Version	$\overline{\text{INH}}$	Q	Oscillator
AL× series	HIGH (or open)	Any $f_0$ , $f_0/2$ , $f_0/4$ , $f_0/8$ , $f_0/16$ or $f_0/32$ output frequency	Normal operation
	LOW	High impedance	Stopped
AH×, AK×, AN×, CN× series	HIGH (or open)	Any $f_0$ , $f_0/2$ , $f_0/4$ , $f_0/8$ , $f_0/16$ or $f_0/32$ output frequency	Normal operation
	LOW	High impedance	Normal operation

### Power-save Pull-up Resistance (AL× series only)

The  $\overline{\text{INH}}$  pull-up resistance changes in response to the input level (HIGH or LOW). When  $\overline{\text{INH}}$  goes LOW (standby state), the pull-up resistance becomes large to reduce the current consumption during standby.
