### ICS843011C FEMTOCLOCKS<sup>™</sup> CRYSTAL-TO-3.3V LVPECL CLOCK GENERATOR

### **GENERAL DESCRIPTION**

The ICS843011C is a Fibre Channel Clock Generator and a member of the HiPerClocks<sup>™</sup> family of high performance devices from ICS. The ICS843011C uses a 26.5625MHz crystal to synthesize 106.25MHz or a 25MHz crystal to

synthesize 100MHz. The ICS843011C has excellent <1ps phase jitter performance, over the 637kHz - 10MHz integration range. The ICS843011C is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

### **F**EATURES

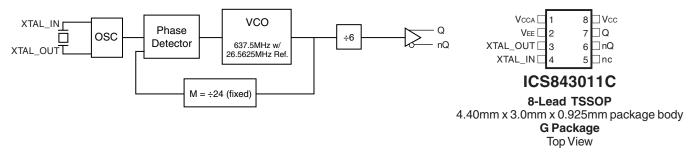

- One differential 3.3V LVPECL output
- Crystal oscillator interface designed for 26.5625MHz 18pF parallel resonant crystal
- Output frequency: 106.25MHz or 100MHz
- VCO range: 560MHz 680MHz
- RMS phase jitter @ 100MHz, using a 25MHz crystal (637kHz 10MHz): 0.29ps (typical)
- 3.3V operating supply
- -40°C to 85°C ambient operating temperature
- Available in both standard and lead-free RoHS compliant packages

#### FREQUENCY TABLE

| Crystal (MHz) | Output Frequency (MHz) |
|---------------|------------------------|
| 26.5625       | 106.25                 |
| 25            | 100                    |

### BLOCK DIAGRAM

### **PIN ASSIGNMENT**

The Preliminary Information presented herein represents a product in prototyping or pre-production. The noted characteristics are based on initial product characterization. Integrated Circuit Systems, Incorporated (ICS) reserves the right to change any circuitry or specifications without notice.

### ICS843011C FEMTOCLOCKS<sup>™</sup> CRYSTAL-TO-3.3V LVPECL CLOCK GENERATOR

# **APPLICATION** INFORMATION

### Power Supply Filtering Techniques

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The ICS843011C provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$  and  $V_{CCA}$ should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a 10 $\Omega$  resistor along with a 10 $\mu$ F and a .01 $\mu$ F bypass capacitor should be connected to each V<sub>CCA</sub> pin.

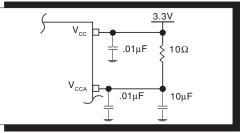

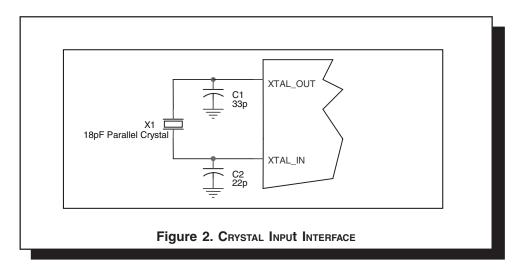

FIGURE 1. POWER SUPPLY FILTERING

### **C**RYSTAL INPUT INTERFACE

The ICS843011C has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 26.5625MHz, 18pF

parallel resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

### ICS843011C FEMTOCLOCKS<sup>™</sup> CRYSTAL-TO-3.3V LVPECL CLOCK GENERATOR

### **APPLICATION SCHEMATIC**

*Figure 3A* shows a schematic example of the ICS843011C. An example of LVEPCL termination is shown in this schematic. Additional LVPECL termination approaches are shown in the LVPECL Termination Application Note. In this example, an 18 pF parallel resonant 26.5625MHz crystal is used for generating 106.25MHz output frequency. The C1 = 27pF and C2 = 33pF are recommended for frequency accuracy. For different board layout, the C1 and C2 values may be slightly adjusted for optimizing frequency accuracy.

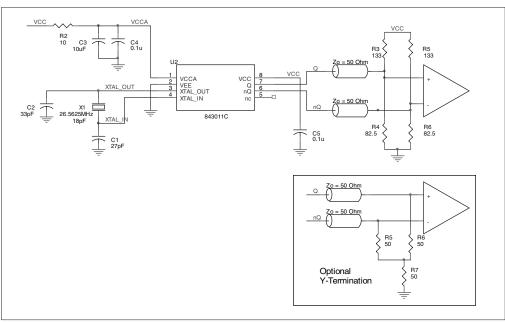

FIGURE 3A. ICS843011C SCHEMATIC EXAMPLE

### PC BOARD LAYOUT EXAMPLE

*Figure 3B* shows an example of ICS843011C P.C. board layout. The crystal X1 footprint shown in this example allows installation of either surface mount HC49S or through-hole HC49 package. The footprints of other components in this example are listed in the *Table 6*. There should be at least one

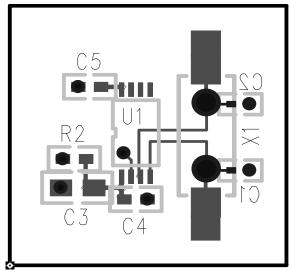

FIGURE 3B. ICS843011 PC BOARD LAYOUT EXAMPLE

decoupling capacitor per power pin. The decoupling capacitors should be located as close as possible to the power pins. The layout assumes that the board has clean analog power ground plane.

| Reference | Size |
|-----------|------|
| C1, C2    | 0402 |
| C3        | 0805 |
| C4, C5    | 0603 |
| R2        | 0603 |

NOTE: Table 6, lists component sizes shown in this layout example.

### ICS843011C FEMTOCLOCKS<sup>™</sup> CRYSTAL-TO-3.3V LVPECL CLOCK GENERATOR

# Power Considerations

This section provides information on power dissipation and junction temperature for the ICS843011C. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS843011C is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{cc} = 3.3V + 5\% = 3.465V$ , which gives worst case results. **NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> = V<sub>CC MAX</sub> \* I<sub>EE MAX</sub> = 3.465V \* 68mA = **235.6mW**
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**

Total Power (3.465V, with all outputs switching) = 235.6mW + 30mW = 265.6mW

2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS<sup>™</sup> devices is 125°C.

The equation for Tj is as follows: Tj =  $\theta_{JA} * Pd_{total} + T_A$ 

Tj = Junction Temperature

 $\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

Pd\_total = Total Device Power Dissipation (example calculation is in section 1 above)

 $T_A =$  Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 90.5°C/W per Table 7 below.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:  $85^{\circ}C + 0.266W * 90.5^{\circ}C/W = 109.1^{\circ}C$ . This is well below the limit of  $125^{\circ}C$ .

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

#### TABLE 7. THERMAL RESISTANCE $\theta_{JA}$ FOR 8-PIN TSSOP, FORCED CONVECTION

| θ <sub>JA</sub> by Velocity                 | (Meters per Sec | ond)     |            |          |

### ICS843011C FEMTOCLOCKS<sup>™</sup> CRYSTAL-TO-3.3V LVPECL CLOCK GENERATOR

#### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load. LVPECL output driver circuit and termination are shown in *Figure 4*.

To calculate worst case power dissipation into the load, use the following equations which assume a  $50\Omega$  load, and a termination voltage of V<sub>cc</sub> - 2V.

• For logic high,  $V_{OUT} = V_{OH_{MAX}} = V_{CC_{MAX}} - 0.9V$ 

$$(V_{CCO_{MAX}} - V_{OH_{MAX}}) = 0.9V$$

• For logic low,  $V_{OUT} = V_{OL_{MAX}} = V_{CC_{MAX}} - 1.7V$ 

$$(V_{CCO MAX} - V_{OL MAX}) = 1.7V$$

Pd\_H is power dissipation when the output drives high. Pd\_L is the power dissipation when the output drives low.

$$Pd_{-}H = [(V_{OH_{-}MAX} - (V_{CC_{-}MAX} - 2V))/R_{-}] * (V_{CC_{-}MAX} - V_{OH_{-}MAX}) = [(2V - (V_{CC_{-}MAX} - V_{OH_{-}MAX}))/R_{-}] * (V_{CC_{-}MAX} - V_{OH_{-}MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

 $Pd_{L} = [(V_{OL_{MAX}} - (V_{CC_{MAX}} - 2V))/R_{L}] * (V_{CC_{MAX}} - V_{OL_{MAX}}) = [(2V - (V_{CC_{MAX}} - V_{OL_{MAX}}))/R_{L}] * (V_{CC_{MAX}} - V_{OL_{MAX}}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$ 

Total Power Dissipation per output pair = Pd\_H + Pd\_L = 30mW
