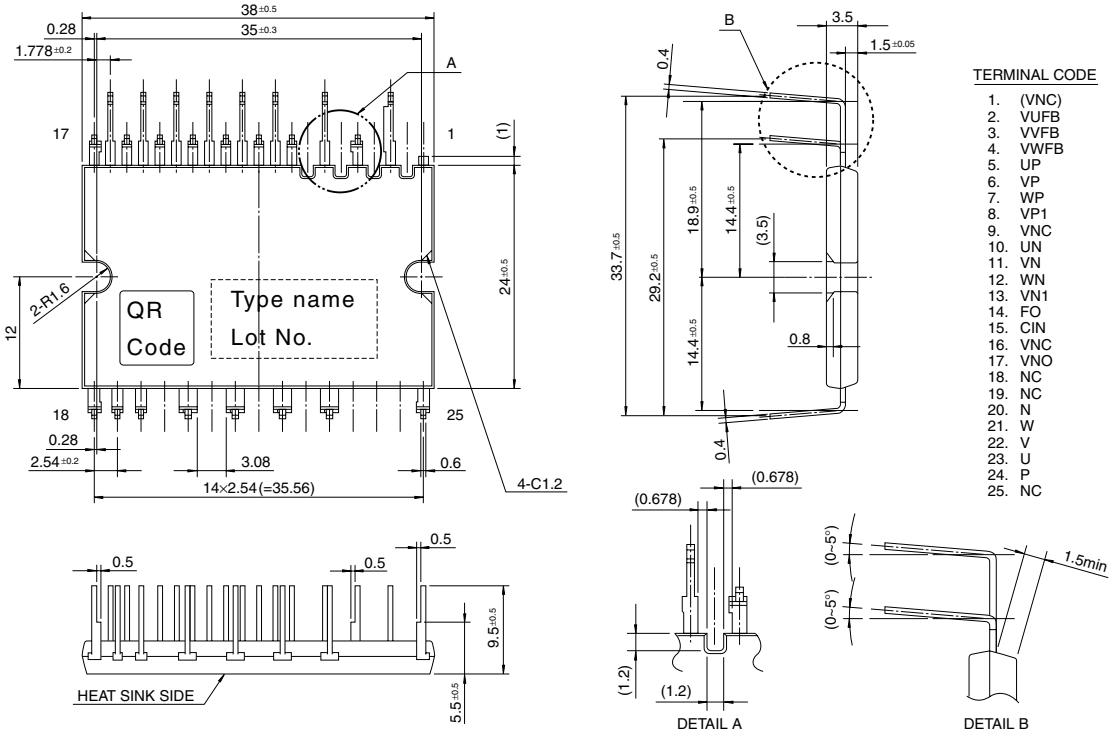

Fig. 4 INTERNAL FUNCTIONS BLOCK DIAGRAM (TYPICAL APPLICATION EXAMPLE)

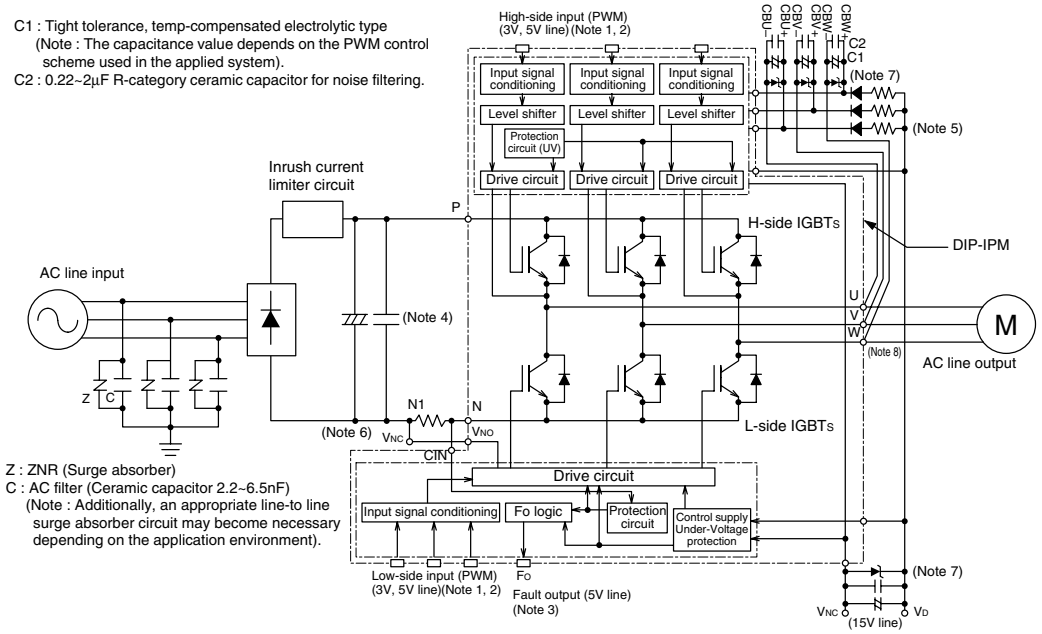


Note1: Input logic is high-active. There is a 3.3kΩ (min) pull-down resistor built-in each input circuit. When using an external CR filter, please make it satisfy the input threshold voltage.

2: By virtue of integrating an application specific type HVIC inside the module, direct coupling to MCU terminals without any opto-coupler or transformer isolation is possible. (see also Fig. 10)

3: This output is open drain type. The signal line should be pulled up to the positive side of the 5V power supply with approximately 10kΩ resistor. (see also Fig. 10)

4: The wiring between the power DC link capacitor and the P & N1 terminals should be as short as possible to protect the DIP-IPM against catastrophic high surge voltages. For extra precaution, a small film type snubber capacitor (0.1~0.22μF, high voltage type) is recommended to be mounted close to these P & N1 DC power input pins.

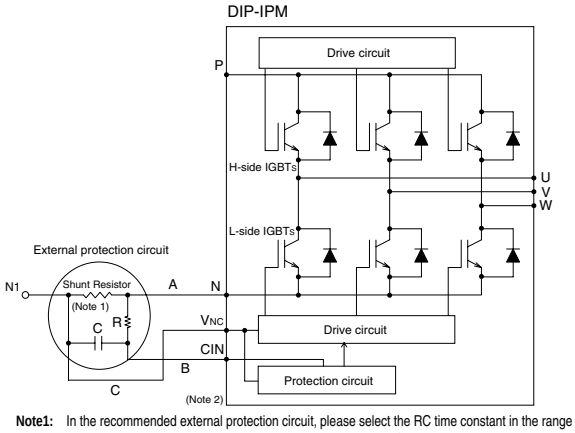
5: High voltage (600V or more) and fast recovery type (less than 100ns) diodes should be used in the bootstrap circuit.

6: The terminal V_{NO} should be connected with the terminal V_{NC} outside.

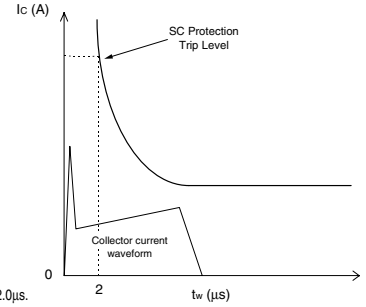
7: It is recommended to insert a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction.

8: Bootstrap negative electrodes should be connected to U, V, W terminals directly and separated from the main output wires.

Fig. 5 EXTERNAL PART OF THE DIP-IPM PROTECTION CIRCUIT



Short Circuit Protective Function (SC) :
SC protection is achieved by sensing the L-side DC-Bus current (through the external shunt resistor) after allowing a suitable filtering time (defined by the RC circuit). When the sensed shunt voltage exceeds the SC trip-level, all the L-side IGBTs are turned OFF and a fault signal (Fo) is output. Since the SC fault may be repetitive, it is recommended to stop the system when the Fo signal is received and check the fault.



Note1: In the recommended external protection circuit, please select the RC time constant in the range 1.5~2.0μs.

2: To prevent erroneous protection operation, the wiring of A, B, C should be as short as possible.

			Min.	Typ.	Max.	
$R_{th(j-c)Q}$	Junction to case thermal resistance (Note 3)	Inverter IGBT part (per 1/6 module)	—	—	4.7	°C/W
$R_{th(j-c)F}$		Inverter FWD part (per 1/6 module)	—	—	5.4	°C/W

Note 3 : Grease with good thermal conductivity should be applied evenly with about +100μm~+200μm on the contacting surface of DIP-IPM and heat-sink.
The contacting thermal resistance between DIP-IPM case and heat sink ($R_{th(c-f)}$) is determined by the thickness and the thermal conductivity of the applied grease. For reference, $R_{th(c-f)}$ (per 1/6 module) is about 0.3°C/W when the grease thickness is 20μm and the thermal conductivity is 1.0W/m·k.

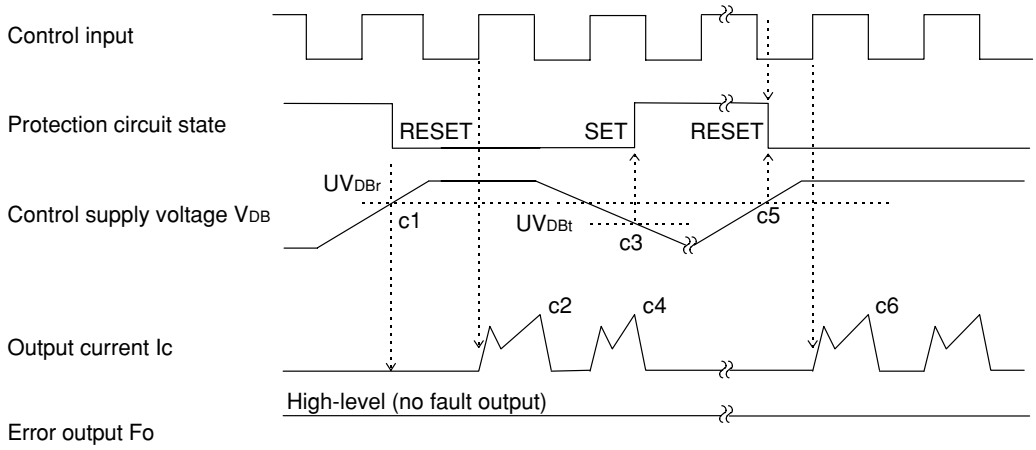

Fig. 8 RECOMMENDED MCU I/O INTERFACE CIRCUIT

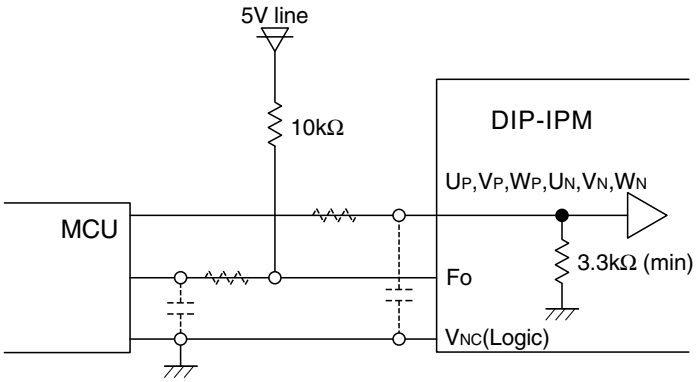

Note : The setting of RC coupling at each input (parts shown dotted) depends on the PWM control scheme and the wiring impedance of the printed circuit board.
The DIP-IPM input section integrates a 3.3kΩ (min) pull-down resistor. Therefore, when using an external filtering resistor, pay attention to the turn-on threshold voltage.

Fig. 9 WIRING CONNECTION OF SHUNT RESISTOR

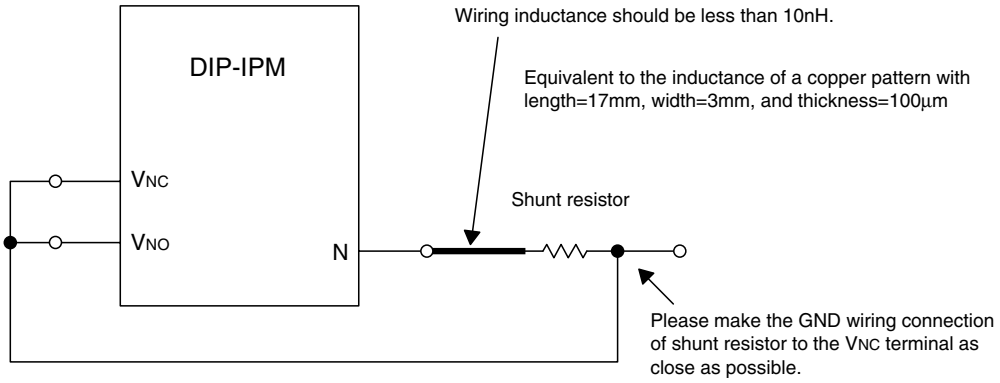

Fig. 10 AN EXAMPLE OF TYPICAL DIP-IPM APPLICATION CIRCUIT

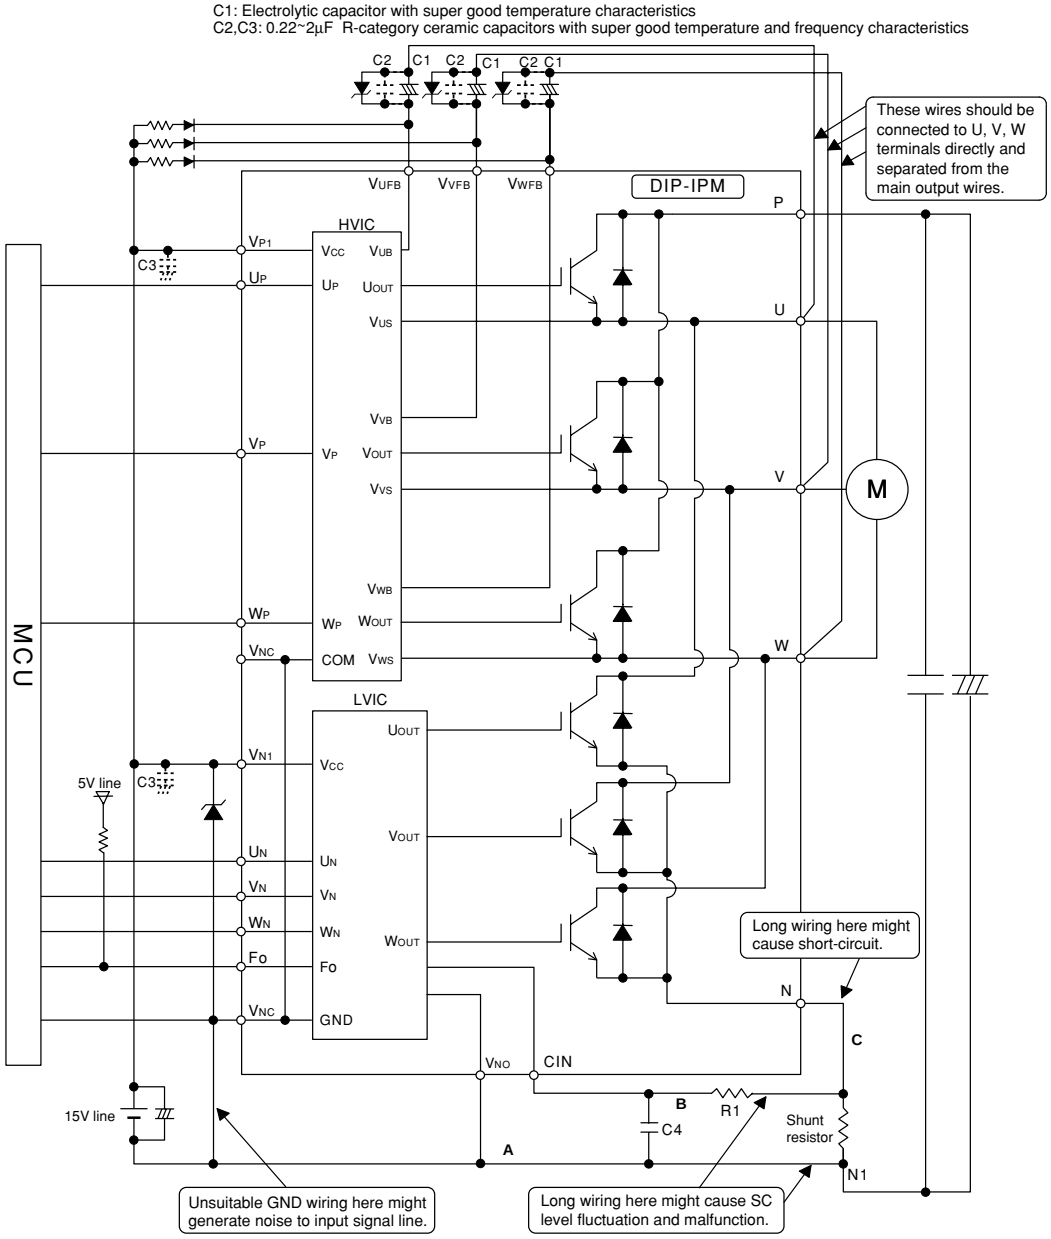

Note 1 : To prevent malfunction, the wiring of each input should be as short as possible (2~3cm).
2 : By virtue of integrating HVIC inside, direct coupling to MCU without opto-coupler or transformer isolation is possible.
3 : FO output is open drain type, it should be pulled up to a 5V supply with an approximately 10kΩ resistor.
4 : The logic of input signal is high-active. The DIP-IPM input signal section integrates a 3.3kΩ (min) pull-down resistor. If using external filtering resistor, ensure the voltage drop of ON signal not below the threshold value.
5 : To prevent malfunction of protection, the wiring of A, B, C should be as short as possible.
6 : Please set the filter R1C4 time constant such that the IGBT can be interrupted within 2μs.
7 : Each capacitor should be located as nearby the pins of the DIP-IPM as possible.
8 : To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 pins should be as short as possible. Approximately a 0.1~0.22μF snubber capacitor between the P&N1 pins is recommended.
9 : Make external wiring connection between VNO and VNC terminals as shown in Fig.9.
10 : Two VNC terminals (9 & 16 pin) are connected inside DIP-IPM, please connect either one to the 15V power supply GND outside and leave another one open.
