

# PIC16CE62X

## OTP 8-Bit CMOS MCU with EEPROM Data Memory

### Devices included in this data sheet:

- PIC16CE623
- PIC16CE624
- PIC16CE625

### High Performance RISC CPU:

- Only 35 instructions to learn
- All single-cycle instructions (200 ns), except for program branches which are two-cycle
- Operating speed:
  - DC - 20 MHz clock input
  - DC - 200 ns instruction cycle

Device	Program Memory	RAM Data Memory	EEPROM Data Memory
PIC16CE623	512x14	96x8	128x8
PIC16CE624	1Kx14	96x8	128x8
PIC16CE625	2Kx14	128x8	128x8

- Interrupt capability
- 16 special function hardware registers
- 8-level deep hardware stack
- Direct, Indirect and Relative addressing modes

### Peripheral Features:

- 13 I/O pins with individual direction control
- High current sink/source for direct LED drive
- Analog comparator module with:
  - Two analog comparators
  - Programmable on-chip voltage reference (VREF) module
  - Programmable input multiplexing from device inputs and internal voltage reference
  - Comparator outputs can be output signals
- Timer0: 8-bit timer/counter with 8-bit programmable prescaler

### Special Microcontroller Features:

- In-Circuit Serial Programming (ICSP™) (via two pins)
- Power-on Reset (POR)
- Power-up Timer (PWRT) and Oscillator Start-up Timer (OST)
- Brown-out Reset
- Watchdog Timer (WDT) with its own on-chip RC oscillator for reliable operation

### Pin Diagrams

### SSOP

### Special Microcontroller Features (cont'd)

- 1,000,000 erase/write cycle EEPROM data memory
- EEPROM data retention > 40 years
- Programmable code protection
- Power saving SLEEP mode
- Selectable oscillator options
- Four user programmable ID locations

### CMOS Technology:

- Low-power, high-speed CMOS EPROM/EEPROM technology
- Fully static design
- Wide operating voltage range
  - 3.0V to 5.5V
- Commercial, industrial and extended temperature range
- Low power consumption
  - < 2.0 mA @ 5.0V, 4.0 MHz
  - 15 µA typical @ 3.0V, 32 kHz
  - < 1.0 µA typical standby current @ 3.0V

## To Our Valued Customers

We constantly strive to improve the quality of all our products and documentation. To this end, we recently converted to a new publishing software package which we believe will enhance our entire documentation process and product. As in any conversion process, information may have accidentally been altered or deleted. We have spent an exceptional amount of time to ensure that these documents are correct. However, we realize that we may have missed a few things. If you find any information that is missing or appears in error from the previous version of this data sheet (PIC16CE62X Data Sheet, Literature Number DS40182A), please use the reader response form in the back of this data sheet to inform us. We appreciate your assistance in making this a better document.

## 1.0 GENERAL DESCRIPTION

The PIC16CE62X are 18 and 20 Pin EPROM-based members of the versatile PICmicro™ family of low-cost, high-performance, CMOS, fully-static, 8-bit microcontrollers with EEPROM data memory.

All PICmicro™ microcontrollers employ an advanced RISC architecture. The PIC16CE62X have enhanced core features, eight-level deep stack, and multiple internal and external interrupt sources. The separate instruction and data buses of the Harvard architecture allow a 14-bit wide instruction word with the separate 8-bit wide data. The two-stage instruction pipeline allows all instructions to execute in a single-cycle, except for program branches (which require two cycles). A total of 35 instructions (reduced instruction set) are available. Additionally, a large register set gives some of the architectural innovations used to achieve a very high performance.

PIC16CE62X microcontrollers typically achieve a 2:1 code compression and a 4:1 speed improvement over other 8-bit microcontrollers in their class.

The PIC16CE623 and PIC16CE624 have 96 bytes of RAM. The PIC16CE625 has 128 bytes of RAM. Each microcontroller contains a 128x8 EEPROM memory array for storing non-volatile information such as calibration data or security codes. This memory has an endurance of 1,000,000 erase/write cycles and a retention of 40 plus years.

Each device has 13 I/O pins and an 8-bit timer/counter with an 8-bit programmable prescaler. In addition, the PIC16CE62X adds two analog comparators with a programmable on-chip voltage reference module. The comparator module is ideally suited for applications requiring a low-cost analog interface (e.g., battery chargers, threshold detectors, white goods controllers, etc).

PIC16CE62X devices have special features to reduce external components, thus reducing system cost, enhancing system reliability and reducing power consumption. There are four oscillator options, of which the single pin RC oscillator provides a low-cost solution, the LP oscillator minimizes power consumption, XT is a standard crystal, and the HS is for High Speed crystals. The SLEEP (power-down) mode offers power savings. The user can wake up the chip from SLEEP through several external and internal interrupts and reset.

A highly reliable Watchdog Timer with its own on-chip RC oscillator provides protection against software lock-up.

A UV-erasable Cerdip-packaged version is ideal for code development while the cost-effective One-Time Programmable (OTP) version is suitable for production in any volume.

Table 1-1 shows the features of the PIC16CE62X mid-range microcontroller families.

A simplified block diagram of the PIC16CE62X is shown in Figure 3-1.

The PIC16CE62X series fit perfectly in applications ranging from multi-pocket battery chargers to low-power remote sensors. The EPROM technology makes customization of application programs (detection levels, pulse generation, timers, etc.) extremely fast and convenient. The small footprint packages make this microcontroller series perfect for all applications with space limitations. Low-cost, low-power, high-performance, ease of use and I/O flexibility make the PIC16CE62X very versatile.

### 1.1 Development Support

The PIC16CE62X family is supported by a full-featured macro assembler, a software simulator, an in-circuit emulator, a low-cost development programmer and a full-featured programmer. A "C" compiler and fuzzy logic support tools are also available.

# PIC16CE62X

TABLE 1-1: PIC16CE62X FAMILY OF DEVICES

		PIC16CE623	PIC16CE624	PIC16CE625
<b>Clock</b>	Maximum Frequency of Operation (MHz)	20	20	20
<b>Memory</b>	EPROM Program Memory (x14 words)	512	1K	2K
	Data Memory (bytes)	96	96	128
<b>Peripherals</b>	EEPROM Data Memory (bytes)	128	128	128
	Timer Module(s)	TMR0	TMR0	TMR0
	Comparators(s)	2	2	2
	Internal Reference Voltage	Yes	Yes	Yes
<b>Features</b>	Interrupt Sources	4	4	4
	I/O Pins	13	13	13
	Voltage Range (Volts)	3.0-5.5	3.0-5.5	3.0-5.5
	Brown-out Reset	Yes	Yes	Yes
	Packages	18-pin DIP, SOIC; 20-pin SSOP	18-pin DIP, SOIC; 20-pin SSOP	18-pin DIP, SOIC; 20-pin SSOP

All PICmicro™ Family devices have Power-on Reset, selectable Watchdog Timer, selectable code protect and high I/O current capability. All PIC16CE62X Family devices use serial programming with clock pin RB6 and data pin RB7.

## 2.0 PIC16CE62X DEVICE VARIETIES

A variety of frequency ranges and packaging options are available. Depending on application and production requirements the proper device option can be selected using the information in the PIC16CE62X Product Identification System section at the end of this data sheet. When placing orders, please use this page of the data sheet to specify the correct part number.

### 2.1 UV Erasable Devices

The UV erasable version, offered in CERDIP package is optimal for prototype development and pilot programs. This version can be erased and reprogrammed to any of the oscillator modes.

Microchip's PICSTART® and PRO MATE® programmers both support programming of the PIC16CE62X.

### 2.2 One-Time-Programmable (OTP) Devices

The availability of OTP devices is especially useful for customers who need the flexibility for frequent code updates and small volume applications. In addition to the program memory, the configuration bits must also be programmed.

### 2.3 Quick-Turn-Programming (QTP) Devices

Microchip offers a QTP Programming Service for factory production orders. This service is made available for users who chose not to program a medium to high quantity of units and whose code patterns have stabilized. The devices are identical to the OTP devices but with all EPROM locations and configuration options already programmed by the factory. Certain code and prototype verification procedures apply before production shipments are available. Please contact your Microchip Technology sales office for more details.

### 2.4 Serialized Quick-Turn-Programming (SQTP<sup>SM</sup>) Devices

Microchip offers a unique programming service where a few user-defined locations in each device are programmed with different serial numbers. The serial numbers may be random, pseudo-random or sequential.

Serial programming allows each device to have a unique number which can serve as an entry-code, password or ID number.

NOTES:

## 3.0 ARCHITECTURAL OVERVIEW

The high performance of the PIC16CE62X family can be attributed to a number of architectural features commonly found in RISC microprocessors. To begin with, the PIC16CE62X uses a Harvard architecture, in which, program and data are accessed from separate memories using separate busses. This improves bandwidth over traditional von Neumann architecture where program and data are fetched from the same memory. Separating program and data memory further allows instructions to be sized differently than 8-bit wide data word. Instruction opcodes are 14-bits wide making it possible to have all single word instructions. A 14-bit wide program memory access bus fetches a 14-bit instruction in a single cycle. A two-stage pipeline overlaps fetch and execution of instructions. Consequently, all instructions (35) execute in a single-cycle (200 ns @ 20 MHz) except for program branches.

The PIC16CE623 addresses 512 x 14 on-chip program memory. The PIC16CE624 addresses 1K x 14 program memory. The PIC16CE625 addresses 2K x 14 program memory. All program memory is internal.

The PIC16CE62X can directly or indirectly address its register files or data memory. All special function registers including the program counter are mapped in the data memory. The PIC16CE62X have an orthogonal (symmetrical) instruction set that makes it possible to carry out any operation on any register using any addressing mode. This symmetrical nature and lack of 'special optimal situations' make programming with the PIC16CE62X simple yet efficient. In addition, the learning curve is reduced significantly.

The PIC16CE62X devices contain an 8-bit ALU and working register. The ALU is a general purpose arithmetic unit. It performs arithmetic and Boolean functions between data in the working register and any register file.

The ALU is 8-bit wide and capable of addition, subtraction, shift and logical operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. In two-operand instructions, typically one operand is the working register (W register). The other operand is a file register or an immediate constant. In single operand instructions, the operand is either the W register or a file register.

The W register is an 8-bit working register used for ALU operations. It is not an addressable register.

Depending on the instruction executed, the ALU may affect the values of the Carry (C), Digit Carry (DC), and Zero (Z) bits in the STATUS register. The C and DC bits operate as a Borrow and Digit Borrow out bit, respectively, bit in subtraction. See the `SUBLW` and `SUBWF` instructions for examples.

A simplified block diagram is shown in Figure 3-1, with a description of the device pins in Table 3-1.

Vss	5	5,6	P	—	Ground reference for logic and I/O pins.
VDD	14	15,16	P	—	Positive supply for logic and I/O pins.

Legend:            O = output                            I/O = input/output            P = power  
                      — = Not used                        I = Input                        ST = Schmitt Trigger input  
                      TTL = TTL input

Note 1: This buffer is a Schmitt Trigger input when configured as the external interrupt.

Note 2: This buffer is a Schmitt Trigger input when used in serial programming mode.

# PIC16CE62X

## 3.1 Clocking Scheme/Instruction Cycle

The clock input (OSC1/CLKIN pin) is internally divided by four to generate four non-overlapping quadrature clocks namely Q1, Q2, Q3 and Q4. Internally, the program counter (PC) is incremented every Q1, the instruction is fetched from the program memory and latched into the instruction register in Q4. The instruction is decoded and executed during the following Q1 through Q4. The clocks and instruction execution flow is shown in Figure 3-2.

## 3.2 Instruction Flow/Pipelining

An "Instruction Cycle" consists of four Q cycles (Q1, Q2, Q3 and Q4). The instruction fetch and execute are pipelined such that fetch takes one instruction cycle while decode and execute takes another instruction cycle. However, due to the pipelining, each instruction effectively executes in one cycle. If an instruction causes the program counter to change (e.g., GOTO) then two cycles are required to complete the instruction (Example 3-1).

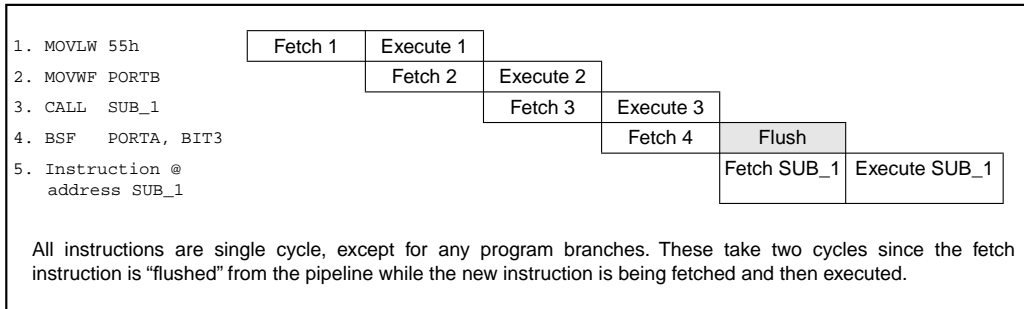

A fetch cycle begins with the program counter (PC) incrementing in Q1.

In the execution cycle, the fetched instruction is latched into the "Instruction Register (IR)" in cycle Q1. This instruction is then decoded and executed during the Q2, Q3, and Q4 cycles. Data memory is read during Q2 (operand read) and written during Q4 (destination write).

**FIGURE 3-2: CLOCK/INSTRUCTION CYCLE**

**EXAMPLE 3-1: INSTRUCTION PIPELINE FLOW**

## 4.0 MEMORY ORGANIZATION

### 4.1 Program Memory Organization

The PIC16CE62X has a 13-bit program counter capable of addressing an 8K x 14 program memory space. Only the first 512 x 14 (0000h - 01FFh) for the PIC16CE623, 1K x 14 (0000h - 03FFh) for the PIC16CE624 and 2K x 14 (0000h - 07FFh) for the PIC16CE625 are physically implemented. Accessing a location above these boundaries will cause a wrap-around within the first 512 x 14 space (PIC16CE623) or 1K x 14 space (PIC16CE624) or 2K x 14 space (PIC16CE625). The reset vector is at 0000h and the interrupt vector is at 0004h (Figure 4-1, Figure 4-2, Figure 4-3).

**FIGURE 4-1: PROGRAM MEMORY MAP AND STACK FOR THE PIC16CE623**

**FIGURE 4-2: PROGRAM MEMORY MAP AND STACK FOR THE PIC16CE624**

**FIGURE 4-3: PROGRAM MEMORY MAP AND STACK FOR THE PIC16CE625**

---

## 4.2 Data Memory Organization

The data memory (Figure 4-4 and Figure 4-5) is partitioned into two Banks which contain the general purpose registers and the special function registers. Bank 0 is selected when the RP0 bit is cleared. Bank 1 is selected when the RP0 bit (STATUS <5>) is set. The Special Function Registers are located in the first 32 locations of each Bank. Register locations 20-7Fh (Bank0) on the PIC16CE623/624 and 20-7Fh (Bank0) and A0-BFh (Bank1) on the PIC16CE625 are general purpose registers implemented as static RAM. Some special purpose registers are mapped in Bank 1. In all three microcontrollers, address space F0h-FFh is mapped to 70-7Fh.

### 4.2.1 GENERAL PURPOSE REGISTER FILE

The register file is organized as 96 x 8 in the PIC16CE623/624 and 128 x 8 in the PIC16CE625. Each is accessed either directly or indirectly through the File Select Register FSR (Section 4.4).

# PIC16CE62X

## 4.2.2 SPECIAL FUNCTION REGISTERS

The special function registers are registers used by the CPU and Peripheral functions for controlling the desired operation of the device (Table 4-1). These registers are static RAM.

The special registers can be classified into two sets (core and peripheral). The special function registers associated with the “core” functions are described in this section. Those related to the operation of the peripheral features are described in the section of that peripheral feature.

**TABLE 4-1: SPECIAL REGISTERS FOR THE PIC16CE62X**

Legend: — = Unimplemented locations read as '0', u = unchanged, x = unknown, q = value depends on condition, shaded = unimplemented

**Note 1:** Other (non power-up) resets include  $\overline{MCLR}$  reset, Brown-out Reset and Watchdog Timer Reset during normal operation.

**Note 2:** IRP & RPI bits are reserved, always maintain these bits clear.

## 4.2.2.1 STATUS REGISTER

The STATUS register, shown in Figure 4-6, contains the arithmetic status of the ALU, the RESET status and the bank select bits for data memory.

The STATUS register can be the destination for any instruction, like any other register. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the  $\overline{TO}$  and  $\overline{PD}$  bits are not writable. Therefore, the result of an instruction with the STATUS register as destination may be different than intended.

For example, `CLRF STATUS` will clear the upper-three bits and set the Z bit. This leaves the status register as `000uu1uu` (where u = unchanged).

It is recommended, therefore, that only `BCF`, `BSF`, `SWAPF` and `MOVWF` instructions are used to alter the STATUS register because these instructions do not affect any status bit. For other instructions, not affecting any status bits, see the "Instruction Set Summary".

**Note 1:** The IRP and RP1 bits (STATUS<7:6>) are not used by the PIC16CE62X and should be programmed as '0'. Use of these bits as general purpose R/W bits is NOT recommended, since this may affect upward compatibility with future products.

**Note 2:** The C and DC bits operate as a Borrow and Digit Borrow out bit, respectively, in subtraction. See the `SUBLW` and `SUBWF` instructions for examples.

**FIGURE 4-6: STATUS REGISTER (ADDRESS 03H OR 83H)**

Reserved	Reserved	R/W-0	R-1	R-1	R/W-x	R/W-x	R/W-x

 W = Writable bit  
 U = Unimplemented bit, read as '0'  
 - n = Value at POR reset  
 -x = Unknown at POR reset

# PIC16CE62X

## 4.2.2.2 OPTION REGISTER

The OPTION register is a readable and writable register which contains various control bits to configure the TMR0/WDT prescaler, the external RB0/INT interrupt, TMR0, and the weak pull-ups on PORTB.

**Note:** To achieve a 1:1 prescaler assignment for TMR0, assign the prescaler to the WDT (PSA = 1).

## 4.2.2.3 INTCON REGISTER

The INTCON register is a readable and writable register which contains the various enable and flag bits for all interrupt sources except the comparator module. See Section 4.2.2.4 and Section 4.2.2.5 for a description of the comparator enable and flag bits.

**Note:** Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>).

**FIGURE 4-8: INTCON REGISTER (ADDRESS 0BH OR 8BH)**

	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-x
	GIE	PEIE	TOIE	INTE	RBIE	TOIF	INTF	RBIF
bit7								bit0

R = Readable bit  
 W = Writable bit  
 U = Unimplemented bit, read as '0'  
 - n = Value at POR reset  
 - x = Unknown at POR reset

bit 7: **GIE:** Global Interrupt Enable bit  
 1 = Enables all un-masked interrupts  
 0 = Disables all interrupts

bit 6: **PEIE:** Peripheral Interrupt Enable bit  
 1 = Enables all un-masked peripheral interrupts  
 0 = Disables all peripheral interrupts

bit 5: **TOIE:** TMR0 Overflow Interrupt Enable bit  
 1 = Enables the TMR0 interrupt  
 0 = Disables the TMR0 interrupt

bit 4: **INTE:** RB0/INT External Interrupt Enable bit  
 1 = Enables the RB0/INT external interrupt  
 0 = Disables the RB0/INT external interrupt

bit 3: **RBIE:** RB Port Change Interrupt Enable bit  
 1 = Enables the RB port change interrupt  
 0 = Disables the RB port change interrupt

bit 2: **TOIF:** TMR0 Overflow Interrupt Flag bit  
 1 = TMR0 register has overflowed (must be cleared in software)  
 0 = TMR0 register did not overflow

bit 1: **INTF:** RB0/INT External Interrupt Flag bit  
 1 = The RB0/INT external interrupt occurred (must be cleared in software)  
 0 = The RB0/INT external interrupt did not occur

bit 0: **RBIF:** RB Port Change Interrupt Flag bit  
 1 = When at least one of the RB7:RB4 pins changed state (must be cleared in software)  
 0 = None of the RB7:RB4 pins have changed state

# PIC16CE62X

## 4.2.2.4 PIE1 REGISTER

This register contains the individual enable bit for the comparator interrupt.

**FIGURE 4-9: PIE1 REGISTER (ADDRESS 8CH)**

## 4.2.2.5 PIR1 REGISTER

This register contains the individual flag bit for the comparator interrupt.

**Note:** Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>). User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

**FIGURE 4-10: PIR1 REGISTER (ADDRESS 0CH)**

## 4.2.2.6 PCON REGISTER

The PCON register contains flag bits to differentiate between a Power-on Reset, an external MCLR reset, WDT reset or a Brown-out Reset.

**Note:** BOR is unknown on Power-on Reset. It must then be set by the user and checked on subsequent resets to see if BOR is cleared, indicating a brown-out has occurred. The BOR status bit is a "don't care" and is not necessarily predictable if the brown-out circuit is disabled (by programming BODEN bit in the Configuration word).

**FIGURE 4-11: PCON REGISTER (ADDRESS 8Eh)**

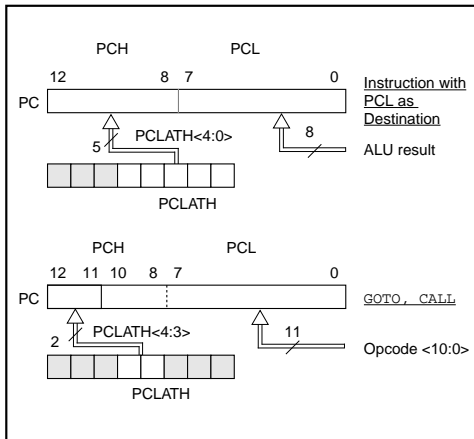

# PIC16CE62X

## 4.3 PCL and PCLATH

The program counter (PC) is 13-bits wide. The low byte comes from the PCL register, which is a readable and writable register. The high byte (PC<12:8>) is not directly readable or writable and comes from PCLATH. On any reset, the PC is cleared. Figure 4-12 shows the two situations for the loading of the PC. The upper example in the figure shows how the PC is loaded on a write to PCL (PCLATH<4:0> → PCH). The lower example in the figure shows how the PC is loaded during a CALL or GOTO instruction (PCLATH<4:3> → PCH).

**FIGURE 4-12: LOADING OF PC IN DIFFERENT SITUATIONS**

### 4.3.1 COMPUTED GOTO

A computed GOTO is accomplished by adding an offset to the program counter (`ADDWF PCL`). When doing a table read using a computed GOTO method, care should be exercised if the table location crosses a PCL memory boundary (each 256 byte block). Refer to the application note "Implementing a Table Read" (AN556).

### 4.3.2 STACK

The PIC16CE62X family has an 8 level deep x 13-bit wide hardware stack (Figure 4-2 and Figure 4-3). The stack space is not part of either program or data space and the stack pointer is not readable or writable. The PC is PUSHed onto the stack when a CALL instruction is executed or an interrupt causes a branch. The stack is POPed in the event of a RETURN, RETLW or a RETFIE instruction execution. PCLATH is not affected by a PUSH or POP operation.

The stack operates as a circular buffer. This means that after the stack has been PUSHed eight times, the ninth push overwrites the value that was stored from the first push. The tenth push overwrites the second push (and so on).

**Note 1:** There are no STATUS bits to indicate stack overflow or stack underflow conditions.

**Note 2:** There are no instruction mnemonics called PUSH or POP. These are actions that occur from the execution of the CALL, RETURN, RETLW and RETFIE instructions, or the vectoring to an interrupt address.

## 4.4 Indirect Addressing, INDF and FSR Registers

The INDF register is not a physical register. Addressing the INDF register will cause indirect addressing.

Indirect addressing is possible by using the INDF register. Any instruction using the INDF register actually accesses data pointed to by the file select register (FSR). Reading INDF itself indirectly will produce 00h. Writing to the INDF register indirectly results in a no-operation (although status bits may be affected). An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>), as shown in Figure 4-13. However, IRP is not used in the PIC16CE62X.

A simple program to clear RAM location 20h-2Fh using indirect addressing is shown in Example 4-1.

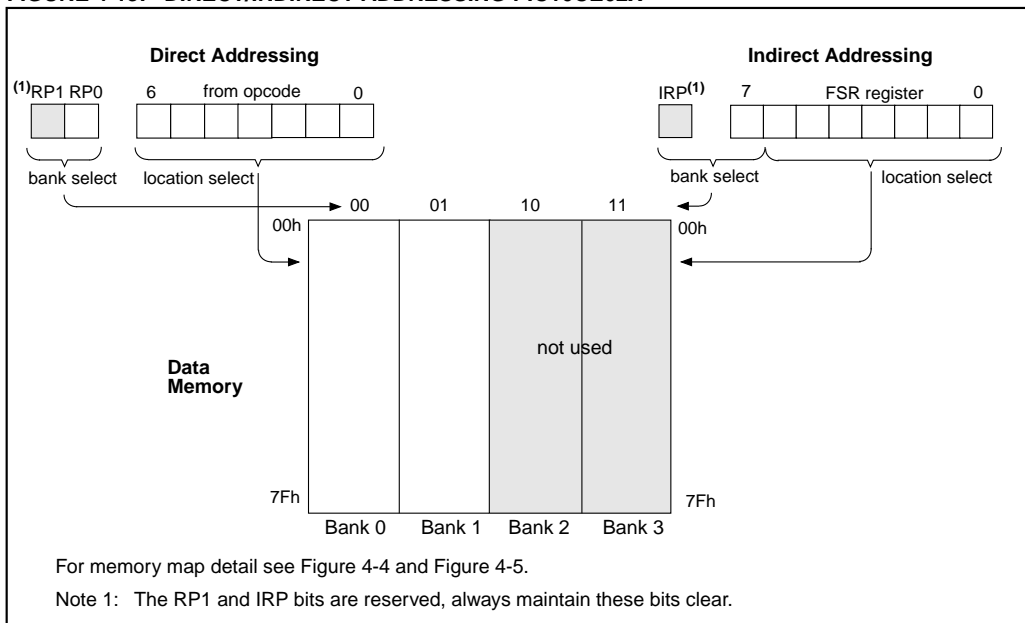

### EXAMPLE 4-1: INDIRECT ADDRESSING

```

movlw 0x20 ;initialize pointer
movwf FSR ;to RAM
NEXT   clrf INDF ;clear INDF register
       incf FSR ;inc pointer
       btfs FSR,4 ;all done?
       goto NEXT ;no clear next
                               ;yes continue
    
```

NOTES:

## 5.0 I/O PORTS

The PIC16CE62X parts have two ports, PORTA and PORTB. Some pins for these I/O ports are multiplexed with an alternate function for the peripheral features on the device. In general, when a peripheral is enabled, that pin may not be used as a general purpose I/O pin.

### 5.1 PORTA and TRISA Registers

PORTA is a 5-bit wide latch. RA4 is a Schmitt Trigger input and an open drain output. Port RA4 is multiplexed with the T0CKI clock input. All other RA port pins have Schmitt Trigger input levels and full CMOS output drivers. All pins have data direction bits (TRIS registers) which can configure these pins as input or output.

A '1' in the TRISA register puts the corresponding output driver in a hi-impedance mode. A '0' in the TRISA register puts the contents of the output latch on the selected pin(s).

Reading the PORTA register reads the status of the pins whereas writing to it will write to the port latch. All write operations are read-modify-write operations. So a write to a port implies that the port pins are first read, then this value is modified and written to the port data latch.

The PORTA pins are multiplexed with comparator and voltage reference functions. The operation of these pins are selected by control bits in the CMCON (comparator control register) register and the VRCON (voltage reference control register) register. When selected as a comparator input, these pins will read as '0's.

**Note:** On reset, the TRISA register is set to all inputs. The digital inputs are disabled and the comparator inputs are forced to ground to reduce excess current consumption.

TRISA controls the direction of the RA pins, even when they are being used as comparator inputs. The user must make sure to keep the pins configured as inputs when using them as comparator inputs.

The RA2 pin will also function as the output for the voltage reference. When in this mode, the VREF pin is a very high impedance output. The user must configure TRISA<2> bit as an input and use high impedance loads.

In one of the comparator modes defined by the CMCON register, pins RA3 and RA4 become outputs of the comparators. The TRISA<4:3> bits must be cleared to enable outputs to use this function.

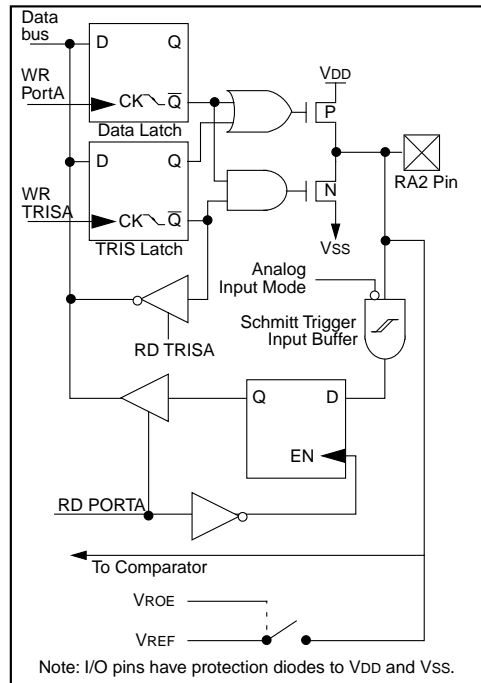

#### EXAMPLE 5-1: INITIALIZING PORTA

```
CLRF PORTA      ;Initialize PORTA by setting
                ;output data latches
MOVLW 0X07      ;Turn comparators off and
MOVWF CMCON     ;enable pins for I/O
                ;functions
BSF STATUS, RP0 ;Select Bank1
MOVLW 0x1F      ;Value used to initialize
                ;data direction
MOVWF TRISA     ;Set RA<4:0> as inputs
                ;TRISA<7:5> are always
                ;read as '0'.
```

Legend: — = Unimplemented locations, read as '0'

**Note:** Note: Shaded bits are not used by PORTA.

# PIC16CE62X

## 5.2 PORTB and TRISB Registers

PORTB is an 8-bit wide bi-directional port. The corresponding data direction register is TRISB. A '1' in the TRISB register puts the corresponding output driver in a high impedance mode. A '0' in the TRISB register puts the contents of the output latch on the selected pin(s).

Reading PORTB register reads the status of the pins, whereas writing to it will write to the port latch. All write operations are read-modify-write operations. So a write to a port implies that the port pins are first read, then this value is modified and written to the port data latch.

Each of the PORTB pins has a weak internal pull-up ( $\approx 200 \mu\text{A}$  typical). A single control bit can turn on all the pull-ups. This is done by clearing the  $\overline{\text{RBP}}\overline{\text{U}}$  (OPTION<7>) bit. The weak pull-up is automatically turned off when the port pin is configured as an output. The pull-ups are disabled on Power-on Reset.

Four of PORTB's pins, RB7:RB4, have an interrupt on change feature. Only pins configured as inputs can cause this interrupt to occur (i.e., any RB7:RB4 pin configured as an output is excluded from the interrupt on change comparison). The input pins (of RB7:RB4) are compared with the old value latched on the last read of PORTB. The "mismatch" outputs of RB7:RB4 are OR'ed together to generate the RBIF interrupt (flag latched in INTCON<0>).

**FIGURE 5-5: BLOCK DIAGRAM OF RB7:RB4 PINS**

This interrupt can wake the device from SLEEP. The user, in the interrupt service routine, can clear the interrupt in the following manner:

- Any read or write of PORTB. This will end the mismatch condition.
- Clear flag bit RBIF.

A mismatch condition will continue to set flag bit RBIF. Reading PORTB will end the mismatch condition, and allow flag bit RBIF to be cleared.

This interrupt on mismatch feature, together with software configurable pull-ups on these four pins allow easy interface to a key pad and make it possible for wake-up on key-depression. (See AN552 in the *Microchip Embedded Control Handbook*.)

**Note:** If a change on the I/O pin should occur when the read operation is being executed (start of the Q2 cycle), then the RBIF interrupt flag may not get set.

The interrupt on change feature is recommended for wake-up on key depression operation and operations where PORTB is only used for the interrupt on change feature. Polling of PORTB is not recommended while using the interrupt on change feature.

**FIGURE 5-6: BLOCK DIAGRAM OF RB3:RB0 PINS**

**TABLE 5-3: PORTB FUNCTIONS**

Name	Bit #	Buffer Type	Function
RB0/INT	bit0	TTL/ST <sup>(1)</sup>	Input/output or external interrupt input. Internal software programmable weak pull-up.
RB1	bit1	TTL	Input/output pin. Internal software programmable weak pull-up.
RB2	bit2	TTL	Input/output pin. Internal software programmable weak pull-up.
RB3	bit3	TTL	Input/output pin. Internal software programmable weak pull-up.
RB4	bit4	TTL	Input/output pin (with interrupt on change). Internal software programmable weak pull-up.
RB5	bit5	TTL	Input/output pin (with interrupt on change). Internal software programmable weak pull-up.
RB6	bit6	TTL/ST <sup>(2)</sup>	Input/output pin (with interrupt on change). Internal software programmable weak pull-up. Serial programming clock pin.
RB7	bit7	TTL/ST <sup>(2)</sup>	Input/output pin (with interrupt on change). Internal software programmable weak pull-up. Serial programming data pin.

Legend: ST = Schmitt Trigger, TTL = TTL input

Note 1: This buffer is a Schmitt Trigger input when configured as the external interrupt.

Note 2: This buffer is a Schmitt Trigger input when used in serial programming mode.

**TABLE 5-4: SUMMARY OF REGISTERS ASSOCIATED WITH PORTB**

# PIC16CE62X

## 5.3 I/O Programming Considerations

### 5.3.1 BI-DIRECTIONAL I/O PORTS

Any instruction which writes, operates internally as a read followed by a write operation. The BCF and BSF instructions, for example, read the register into the CPU, execute the bit operation and write the result back to the register. Caution must be used when these instructions are applied to a port with both inputs and outputs defined. For example, a BSF operation on bit5 of PORTB will cause all eight bits of PORTB to be read into the CPU. Then the BSF operation takes place on bit5 and PORTB is written to the output latches. If another bit of PORTB is used as a bidirectional I/O pin (e.g., bit0) and it is defined as an input at this time, the input signal present on the pin itself would be read into the CPU and re-written to the data latch of this particular pin, overwriting the previous content. As long as the pin stays in the input mode, no problem occurs. However, if bit0 is switched into output mode later on, the content of the data latch may now be unknown.

Reading the port register, reads the values of the port pins. Writing to the port register writes the value to the port latch. When using read modify write instructions (ex. BCF, BSF, etc.) on a port, the value of the port pins is read, the desired operation is done to this value, and this value is then written to the port latch.

Example 5-2 shows the effect of two sequential read-modify-write instructions (ex., BCF, BSF, etc.) on an I/O port.

A pin actively outputting a Low or High should not be driven from external devices at the same time in order to change the level on this pin ("wired-or", "wired-and"). The resulting high output currents may damage the chip.

### EXAMPLE 5-2: READ-MODIFY-WRITE INSTRUCTIONS ON AN I/O PORT

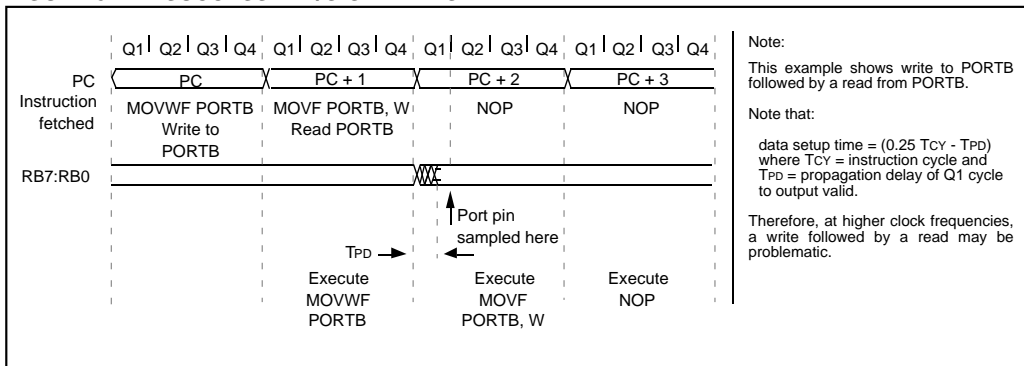

```

; Initial PORT settings:  PORTB<7:4> Inputs
;
;                               PORTB<3:0> Outputs
; PORTB<7:6> have external pull-up and are not
; connected to other circuitry
;
;                               PORT latch  PORT pins
;                               -----
;
;                               BCF PORTB, 7      ; 01pp pppp   11pp pppp
;                               BCF PORTB, 6      ; 10pp pppp   11pp pppp
;                               BSF STATUS,RP0    ;
;                               BCF TRISB, 7      ; 10pp pppp   11pp pppp
;                               BCF TRISB, 6      ; 10pp pppp   10pp pppp
;
; Note that the user may have expected the pin
; values to be 00pp pppp. The 2nd BCF caused
; RB7 to be latched as the pin value (High).
    
```

### 5.3.2 SUCCESSIVE OPERATIONS ON I/O PORTS

The actual write to an I/O port happens at the end of an instruction cycle, whereas for reading, the data must be valid at the beginning of the instruction cycle (Figure 5-7). Therefore, care must be exercised if a write followed by a read operation is carried out on the same I/O port. The sequence of instructions should be such to allow the pin voltage to stabilize (load dependent) before the next instruction which causes that file to be read into the CPU is executed. Otherwise, the previous state of that pin may be read into the CPU rather than the new state. When in doubt, it is better to separate these instructions with a NOP or another instruction not accessing this I/O port.

FIGURE 5-7: SUCCESSIVE I/O OPERATION

## 6.0 EEPROM PERIPHERAL OPERATION

The PIC16CE623/624/625 each have 128 bytes of EEPROM data memory. The EEPROM data memory supports a bi-directional 2-wire bus and data transmission protocol. These two-wires are serial data (SDA) and serial clock (SCL), that are mapped to bit1 and bit2, respectively, of the EEINTF register (SFR 90h). In addition, the power to the EEPROM can be controlled using bit0 (EEVDD) of the EEINTF register. For most applications, all that is required is calls to the following functions:

```

; Byte_Write: Byte write routine
;   Inputs: EEPROM Address   EEADDR
;           EEPROM Data     EEDATA
;   Outputs: Return 01 in W if OK, else
;            return 00 in W
;
; Read_Current: Read EEPROM at address
;               currently held by EE device.
;   Inputs: NONE
;   Outputs: EEPROM Data     EEDATA
;            Return 01 in W if OK, else
;            return 00 in W
;
; Read_Random: Read EEPROM byte at supplied
;               address
;   Inputs: EEPROM Address   EEADDR
;   Outputs: EEPROM Data     EEDATA
;            Return 01 in W if OK,
;            else return 00 in W
    
```

The code for these functions is not yet determined, but will be available on our web site ([www.microchip.com](http://www.microchip.com)) when it is completed. The code will be accessed by either including the source code FLASH62X.INC or by linking FLASH62X.ASM.

### 6.0.1 SERIAL DATA

SDA is a bi-directional pin used to transfer addresses and data into and data out of the memory.

For normal data transfer SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating the START and STOP conditions.

### 6.0.2 SERIAL CLOCK

This SCL input is used to synchronize the data transfer from and to the memory.

### 6.0.3 EEINTF REGISTER

The EEINTF register (SFR 90h) controls the access to the EEPROM. Figure 6.1 details the function of each bit. User code must generate the clock and data signals.

**FIGURE 6-1: EEINTF REGISTER (ADDRESS 90h)**

# PIC16CE62X

---

## 6.1 BUS CHARACTERISTICS

In this section, the term “processor” refers to the portion of the PIC16CE62X that interfaces to the EEPROM through software manipulating the EEINTF register. The following **bus protocol** is to be used with the EEPROM data memory.

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is HIGH. Changes in the data line while the clock line is HIGH will be interpreted by the EEPROM as a START or STOP condition.

Accordingly, the following bus conditions have been defined (Figure 6-2).

### 6.1.1 BUS NOT BUSY (A)

Both data and clock lines remain HIGH.

### 6.1.2 START DATA TRANSFER (B)

A HIGH to LOW transition of the SDA line while the clock (SCL) is HIGH determines a START condition. All commands must be preceded by a START condition.

### 6.1.3 STOP DATA TRANSFER (C)

A LOW to HIGH transition of the SDA line while the clock (SCL) is HIGH determines a STOP condition. All operations must be ended with a STOP condition.

### 6.1.4 DATA VALID (D)

The state of the data line represents valid data when, after a START condition, the data line is stable for the duration of the HIGH period of the clock signal.

The data on the line must be changed during the LOW period of the clock signal. There is one bit of data per clock pulse.

Each data transfer is initiated with a START condition and terminated with a STOP condition. The number of the data bytes transferred between the START and STOP conditions is determined by the processor and is theoretically unlimited, although only the last sixteen will be stored when doing a write operation. When an overwrite does occur, it will replace data in a first-in, first-out fashion.

## 6.1.5 ACKNOWLEDGE

The EEPROM will generate an acknowledge after the reception of each byte. The processor must generate an extra clock pulse which is associated with this acknowledge bit.

**Note:** Acknowledge bits are not generated if an internal programming cycle is in progress.

When the EEPROM acknowledges, it pulls down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse. Of course, setup and hold times must be taken into account. The processor must signal an end of data to the EEPROM by not generating an acknowledge bit on the last byte that has been clocked out of the EEPROM. In this case, the EEPROM must leave the data line HIGH to enable the processor to generate the STOP condition (Figure 6-3).

**FIGURE 6-2: DATA TRANSFER SEQUENCE ON THE SERIAL BUS**

**FIGURE 6-3: ACKNOWLEDGE TIMING**

## 6.2 Device Addressing

After generating a START condition, the processor transmits a control byte consisting of a EEPROM address and a Read/Write bit that indicates what type of operation is to be performed. The EEPROM address consists of a 4-bit device code (1010) followed by three don't care bits.

The last bit of the control byte determines the operation to be performed. When set to a one a read operation is selected, and when set to a zero a write operation is selected. (Figure 6-4). The bus is monitored for its corresponding EEPROM address all the time. It generates an acknowledge bit if the EEPROM address was true and it is not in a programming mode.

**FIGURE 6-4: CONTROL BYTE FORMAT**

# PIC16CE62X

## 6.3 WRITE OPERATIONS

### 6.3.1 BYTE WRITE

Following the start signal from the processor, the device code (4 bits), the don't care bits (3 bits), and the R/W bit which is a logic low is placed onto the bus by the processor. This indicates to the EEPROM that a byte with a word address will follow after it has generated an acknowledge bit during the ninth clock cycle. Therefore the next byte transmitted by the processor is the word address and will be written into the address pointer of the EEPROM. After receiving another acknowledge signal from the EEPROM the processor will transmit the data word to be written into the addressed memory location. The EEPROM acknowledges again and the processor generates a stop condition. This initiates the internal write cycle, and during this time the EEPROM will not generate acknowledge signals (Figure 6-6).

### 6.3.2 PAGE WRITE

The write control byte, word address and the first data byte are transmitted to the EEPROM in the same way as in a byte write. But instead of generating a stop condition the processor transmits up to eight data bytes to the EEPROM which are temporarily stored in the on-chip page buffer and will be written into the memory after the processor has transmitted a stop condition. After the receipt of each word, the three lower order address pointer bits are internally incremented by one. The higher order five bits of the word address remains constant. If the processor should transmit more than eight words prior to generating the stop condition, the address counter will roll over and the previously received data will be overwritten. As with the byte write operation, once the stop condition is received an internal write cycle will begin (Figure 6-7).

## 6.4 ACKNOWLEDGE POLLING

Since the EEPROM will not acknowledge during a write cycle, this can be used to determine when the cycle is complete (this feature can be used to maximize bus throughput). Once the stop condition for a write command has been issued from the processor, the EEPROM initiates the internally timed write cycle. ACK polling can be initiated immediately. This involves the processor sending a start condition followed by the control byte for a write command (R/W = 0). If the device is still busy with the write cycle, then no ACK will be returned. If no ACK is returned, then the start bit and control byte must be re-sent. If the cycle is complete, then the device will return the ACK and the processor can then proceed with the next read or write command. See Figure 6-5 for flow diagram.

**FIGURE 6-5: ACKNOWLEDGE POLLING FLOW**

**FIGURE 6-6: BYTE WRITE**

**FIGURE 6-7: PAGE WRITE**

## 6.5 READ OPERATION

Read operations are initiated in the same way as write operations with the exception that the R/W bit of the EEPROM address is set to one. There are three basic types of read operations: current address read, random read, and sequential read.

### 6.6 Current Address Read

The EEPROM contains an address counter that maintains the address of the last word accessed, internally incremented by one. Therefore, if the previous access (either a read or write operation) was to address  $n$ , the next current address read operation would access data from address  $n + 1$ . Upon receipt of the EEPROM address with R/W bit set to one, the EEPROM issues an acknowledge and transmits the eight bit data word. The processor will not acknowledge the transfer but does generate a stop condition and the EEPROM discontinues transmission (Figure 6-8).

### 6.7 Random Read

Random read operations allow the processor to access any memory location in a random manner. To perform this type of read operation, first the word address must be set. This is done by sending the word address to the EEPROM as part of a write operation. After the word address is sent, the processor generates a start condition following the acknowledge. This terminates the write operation, but not before the internal address pointer is set. Then the processor issues the control byte again but with the R/W bit set to a one. The EEPROM will then issue an acknowledge and transmits the eight bit data word. The processor will not acknowledge the transfer but does generate a stop condition and the EEPROM discontinues transmission (Figure 6-9).

### 6.8 Sequential Read

Sequential reads are initiated in the same way as a random read except that after the EEPROM transmits the first data byte, the processor issues an acknowledge as opposed to a stop condition in a random read. This directs the EEPROM to transmit the next sequentially addressed 8-bit word (Figure 6-10).

To provide sequential reads the EEPROM contains an internal address pointer which is incremented by one at the completion of each operation. This address pointer allows the entire memory contents to be serially read during one operation.

### 6.9 Noise Protection

The EEPROM employs a  $V_{CC}$  threshold detector circuit which disables the internal erase/write logic if the  $V_{CC}$  is below 1.5 volts at nominal conditions.

The SCL and SDA inputs have Schmitt trigger and filter circuits which suppress noise spikes to assure proper device operation even on a noisy bus.

# PIC16CE62X

**FIGURE 6-8: CURRENT ADDRESS READ**

**FIGURE 6-9: RANDOM READ**

**FIGURE 6-10: SEQUENTIAL READ**

## 7.0 TIMER0 MODULE

The Timer0 module timer/counter has the following features:

- 8-bit timer/counter
- Readable and writable
- 8-bit software programmable prescaler
- Internal or external clock select
- Interrupt on overflow from FFh to 00h
- Edge select for external clock

Figure 7-1 is a simplified block diagram of the Timer0 module.

Timer mode is selected by clearing the T0CS bit (OPTION<5>). In timer mode, the TMR0 will increment every instruction cycle (without prescaler). If Timer0 is written, the increment is inhibited for the following two cycles (Figure 7-2 and Figure 7-3). The user can work around this by writing an adjusted value to TMR0.

Counter mode is selected by setting the T0CS bit. In this mode Timer0 will increment either on every rising or falling edge of pin RA4/T0CKI. The incrementing edge is determined by the source edge (T0SE) control

bit (OPTION<4>). Clearing the T0SE bit selects the rising edge. Restrictions on the external clock input are discussed in detail in Section 7.2.

The prescaler is shared between the Timer0 module and the WatchdogTimer. The prescaler assignment is controlled in software by the control bit PSA (OPTION<3>). Clearing the PSA bit will assign the prescaler to Timer0. The prescaler is not readable or writable. When the prescaler is assigned to the Timer0 module, prescale value of 1:2, 1:4, ..., 1:256 are selectable. Section 7.3 details the operation of the prescaler.

### 7.1 TIMER0 Interrupt

Timer0 interrupt is generated when the TMR0 register timer/counter overflows from FFh to 00h. This overflow sets the T0IF bit. The interrupt can be masked by clearing the T0IE bit (INTCON<5>). The T0IF bit (INTCON<2>) must be cleared in software by the Timer0 module interrupt service routine before re-enabling this interrupt. The Timer0 interrupt cannot wake the processor from SLEEP since the timer is shut off during SLEEP. See Figure 7-4 for Timer0 interrupt timing.

**FIGURE 7-1: TIMER0 BLOCK DIAGRAM**

**FIGURE 7-2: TIMER0 (TMR0) TIMING: INTERNAL CLOCK/NO PRESCALER**

# PIC16CE62X

**FIGURE 7-3: TIMER0 TIMING: INTERNAL CLOCK/PRESCALE 1:2**

**FIGURE 7-4: TIMER0 INTERRUPT TIMING**

## 7.2 Using Timer0 with External Clock

When an external clock input is used for Timer0, it must meet certain requirements. The external clock requirement is due to internal phase clock (TOSC) synchronization. Also, there is a delay in the actual incrementing of Timer0 after synchronization.

### 7.2.1 EXTERNAL CLOCK SYNCHRONIZATION

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of T0CKI with the internal phase clocks is accomplished by sampling the prescaler output on the Q2 and Q4 cycles of the internal phase clocks (Figure 7-5). Therefore, it is necessary for T0CKI to be high for at least  $2T_{OSC}$  (and a small RC delay of 20 ns) and low for at least  $2T_{OSC}$  (and a small RC delay of 20 ns). Refer to the electrical specification of the desired device.

When a prescaler is used, the external clock input is divided by the asynchronous ripple-counter type prescaler so that the prescaler output is symmetrical. For the external clock to meet the sampling requirement, the ripple-counter must be taken into account. Therefore, it is necessary for T0CKI to have a period of at least  $4T_{OSC}$  (and a small RC delay of 40 ns) divided by the prescaler value. The only requirement on T0CKI high and low time is that they do not violate the minimum pulse width requirement of 10 ns. Refer to parameters 40, 41 and 42 in the electrical specification of the desired device.

### 7.2.2 TIMER0 INCREMENT DELAY

Since the prescaler output is synchronized with the internal clocks, there is a small delay from the time the external clock edge occurs to the time the TMR0 is actually incremented. Figure 7-5 shows the delay from the external clock edge to the timer incrementing.

**FIGURE 7-5: TIMER0 TIMING WITH EXTERNAL CLOCK**

# PIC16CE62X

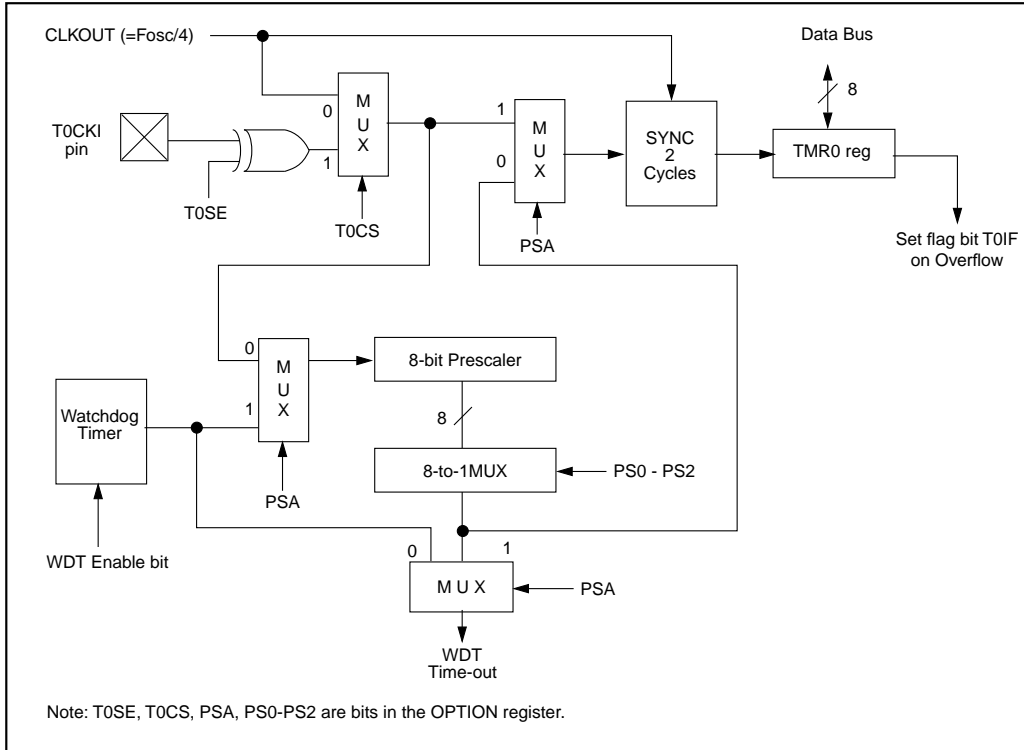

## 7.3 Prescaler

An 8-bit counter is available as a prescaler for the Timer0 module, or as a postscaler for the Watchdog Timer, respectively (Figure 7-6). For simplicity, this counter is being referred to as “prescaler” throughout this data sheet. Note that there is only one prescaler available which is mutually exclusive between the Timer0 module and the Watchdog Timer. Thus, a prescaler assignment for the Timer0 module means that there is no prescaler for the Watchdog Timer, and vice-versa.

The PSA and PS2:PS0 bits (OPTION<3:0>) determine the prescaler assignment and prescale ratio.

When assigned to the Timer0 module, all instructions writing to the TMR0 register (e.g., CLRWF 1, MOVWF 1, BSF 1,x,...etc.) will clear the prescaler. When assigned to WDT, a CLRWDT instruction will clear the prescaler along with the Watchdog Timer. The prescaler is not readable or writable.

**FIGURE 7-6: BLOCK DIAGRAM OF THE TIMER0/WDT PRESCALER**

## 7.3.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control (i.e., it can be changed “on the fly” during program execution). To avoid an unintended device RESET, the following instruction sequence (Example 7-1) must be executed when changing the prescaler assignment from Timer0 to WDT.

### EXAMPLE 7-1: CHANGING PRESCALER (TIMER0→WDT)

```

1. BCF STATUS, RP0 ;Skip if already in
   ; Bank 0
2. CLRWDT ;Clear WDT
3. CLRF TMR0 ;Clear TMR0 & Prescaler
4. BSF STATUS, RP0 ;Bank 1
5. MOVLW '00101111'b; ;These 3 lines (5, 6, 7)
6. MOVWF OPTION ; are required only if
   ; desired PS<2:0> are
   ; 000 or 001
7. CLRWDT ; 000 or 001
8. MOVLW '00101xxx'b ;Set Postscaler to
9. MOVWF OPTION ; desired WDT rate
10. BCF STATUS, RP0 ;Return to Bank 0
    
```

To change prescaler from the WDT to the TMR0 module use the sequence shown in Example 7-2. This precaution must be taken even if the WDT is disabled.

### EXAMPLE 7-2: CHANGING PRESCALER (WDT→TIMER0)

```

CLRWDT ;Clear WDT and
;prescaler
BSF STATUS, RP0
MOVLW b'xxxx0xxx' ;Select TMR0, new
;prescale value and
;clock source
MOVWF OPTION_REG
BCF STATUS, RP0
    
```

NOTES:

## 8.0 COMPARATOR MODULE

The comparator module contains two analog comparators. The inputs to the comparators are multiplexed with the RA0 through RA3 pins. The on-chip Voltage Reference (Section 9.0) can also be an input to the comparators.

The CMCON register, shown in Figure 8-1, controls the comparator input and output multiplexers. A block diagram of the comparator is shown in Figure 8-2.

**FIGURE 8-1: CMCON REGISTER (ADDRESS 1Fh)**

## 8.1 Comparator Configuration

There are eight modes of operation for the comparators. The CMCON register is used to select the mode. Figure 8-2 shows the eight possible modes. The TRISA register controls the data direction of the comparator pins for each mode. If the comparator mode is

changed, the comparator output level may not be valid for the specified mode change delay shown in Table 13-2.

**Note:** Comparator interrupts should be disabled during a comparator mode change otherwise a false interrupt may occur.

**FIGURE 8-2: COMPARATOR I/O OPERATING MODES**

The code example in Example 8-1 depicts the steps required to configure the comparator module. RA3 and RA4 are configured as digital output. RA0 and RA1 are configured as the V- inputs and RA2 as the V+ input to both comparators.

```

## 8.2 Comparator Operation

A single comparator is shown in Figure 8-3 along with the relationship between the analog input levels and the digital output. When the analog input at VIN+ is less than the analog input VIN-, the output of the comparator is a digital low level. When the analog input at VIN+ is greater than the analog input VIN-, the output of the comparator is a digital high level. The shaded areas of the output of the comparator in Figure 8-3 represent the uncertainty due to input offsets and response time.

## 8.3 Comparator Reference

An external or internal reference signal may be used depending on the comparator operating mode. The analog signal that is present at VIN- is compared to the signal at VIN+, and the digital output of the comparator is adjusted accordingly (Figure 8-3).

FIGURE 8-3: SINGLE COMPARATOR

### 8.3.1 EXTERNAL REFERENCE SIGNAL

When external voltage references are used, the comparator module can be configured to have the comparators operate from the same or different reference sources. However, threshold detector applications may require the same reference. The reference signal must be between VSS and VDD, and can be applied to either pin of the comparator(s).

### 8.3.2 INTERNAL REFERENCE SIGNAL

The comparator module also allows the selection of an internally generated voltage reference for the comparators. Section 13, Instruction Sets, contains a detailed description of the Voltage Reference Module that provides this signal. The internal reference signal is used when the comparators are in mode CM<2:0>=010 (Figure 8-2). In this mode, the internal voltage reference is applied to the VIN+ pin of both comparators.

# PIC16CE62X

## 8.4 Comparator Response Time

Response time is the minimum time, after selecting a new reference voltage or input source, before the comparator output is guaranteed to have a valid level. If the internal reference is changed, the maximum delay of the internal voltage reference must be considered when using the comparator outputs. Otherwise the maximum delay of the comparators should be used (Table 13-2).

## 8.5 Comparator Outputs

The comparator outputs are read through the CMCON register. These bits are read only. The comparator outputs may also be directly output to the RA3 and RA4 I/O pins. When the CM<2:0> = 110, multiplexors in the output path of the RA3 and RA4 pins will switch and the output of each pin will be the unsynchronized output of the comparator. The uncertainty of each of the comparators is related to the input offset voltage and the response time given in the specifications. Figure 8-4 shows the comparator output block diagram.

The TRISA bits will still function as an output enable/disable for the RA3 and RA4 pins while in this mode.

**Note 1:** When reading the PORT register, all pins configured as analog inputs will read as a '0'. Pins configured as digital inputs will convert an analog input according to the Schmitt Trigger input specification.

**2:** Analog levels on any pin that is defined as a digital input may cause the input buffer to consume more current than is specified.

FIGURE 8-4: COMPARATOR OUTPUT BLOCK DIAGRAM

## 8.6 Comparator Interrupts

The comparator interrupt flag is set whenever there is a change in the output value of either comparator. Software will need to maintain information about the status of the output bits, as read from CMCON<7:6>, to determine the actual change that has occurred. The CMIF bit, PIR1<6>, is the comparator interrupt flag. The CMIF bit must be reset by clearing '0'. Since it is also possible to write a '1' to this register, a simulated interrupt may be initiated.

The CMIE bit (PIE1<6>) and the PEIE bit (INTCON<6>) must be set to enable the interrupt. In addition, the GIE bit must also be set. If any of these bits are clear, the interrupt is not enabled, though the CMIF bit will still be set if an interrupt condition occurs.

**Note:** If a change in the CMCON register (C1OUT or C2OUT) should occur when a read operation is being executed (start of the Q2 cycle), then the CMIF (PIR1<6>) interrupt flag may not get set.

The user, in the interrupt service routine, can clear the interrupt in the following manner:

- a) Any read or write of CMCON. This will end the mismatch condition.
- b) Clear flag bit CMIF.

A mismatch condition will continue to set flag bit CMIF. Reading CMCON will end the mismatch condition, and allow flag bit CMIF to be cleared.

## 8.7 Comparator Operation During SLEEP

When a comparator is active and the device is placed in SLEEP mode, the comparator remains active and the interrupt is functional if enabled. This interrupt will

wake up the device from SLEEP mode when enabled. While the comparator is powered-up, higher sleep currents than shown in the power down current specification will occur. Each comparator that is operational will consume additional current as shown in the comparator specifications. To minimize power consumption while in SLEEP mode, turn off the comparators, CM<2:0> = 111, before entering sleep. If the device wakes-up from sleep, the contents of the CMCON register are not affected.

## 8.8 Effects of a RESET

A device reset forces the CMCON register to its reset state. This forces the comparator module to be in the comparator reset mode, CM2:CM0 = 000. This ensures that all potential inputs are analog inputs. Device current is minimized when analog inputs are present at reset time. The comparators will be powered-down during the reset interval.

## 8.9 Analog Input Connection Considerations

A simplified circuit for an analog input is shown in Figure 8-5. Since the analog pins are connected to a digital output, they have reverse biased diodes to VDD and VSS. The analog input therefore, must be between VSS and VDD. If the input voltage deviates from this range by more than 0.6V in either direction, one of the diodes is forward biased and a latch-up may occur. A maximum source impedance of 10 kΩ is recommended for the analog sources. Any external component connected to an analog input pin, such as a capacitor or a Zener diode, should have very little leakage current.

**FIGURE 8-5: ANALOG INPUT MODEL**

## 9.0 VOLTAGE REFERENCE MODULE

The Voltage Reference is a 16-tap resistor ladder network that provides a selectable voltage reference. The resistor ladder is segmented to provide two ranges of VREF values and has a power-down function to conserve power when the reference is not being used. The VRCON register controls the operation of the reference as shown in Figure 9-1. The block diagram is given in Figure 9-2.

## 9.1 Configuring the Voltage Reference

The Voltage Reference can output 16 distinct voltage levels for each range.

The equations used to calculate the output of the Voltage Reference are as follows:

$$\text{if } VRR = 1: VREF = (VR<3:0>/24) \times VDD$$

$$\text{if } VRR = 0: VREF = (VDD \times 1/4) + (VR<3:0>/32) \times VDD$$

The setting time of the Voltage Reference must be considered when changing the VREF output (Table 13-2). Example 9-1 shows an example of how to configure the Voltage Reference for an output voltage of 1.25V with VDD = 5.0V.

**FIGURE 9-1: VRCON REGISTER (ADDRESS 9Fh)**

**FIGURE 9-2: VOLTAGE REFERENCE BLOCK DIAGRAM**

# PIC16CE62X

## EXAMPLE 9-1: VOLTAGE REFERENCE CONFIGURATION

```

                        ; set Vr<3:0>=6
BCF      STATUS,RP0  ; go to Bank 0
CALL     DELAY10     ; 10µs delay
    
```

### 9.2 Voltage Reference Accuracy/Error

The full range of VSS to VDD cannot be realized due to the construction of the module. The transistors on the top and bottom of the resistor ladder network (Figure 9-2) keep VREF from approaching VSS or VDD. The Voltage Reference is VDD derived and therefore, the VREF output changes with fluctuations in VDD. The absolute accuracy of the Voltage Reference can be found in Table 13-3.

### 9.3 Operation During Sleep

When the device wakes up from sleep through an interrupt or a Watchdog Timer time-out, the contents of the VRCON register are not affected. To minimize current consumption in SLEEP mode, the Voltage Reference should be disabled.

## 9.4 Effects of a Reset

A device reset disables the Voltage Reference by clearing bit VREN (VRCON<7>). This reset also disconnects the reference from the RA2 pin by clearing bit VROE (VRCON<6>) and selects the high voltage range by clearing bit VRR (VRCON<5>). The VREF value select bits, VRCON<3:0>, are also cleared.

## 9.5 Connection Considerations

The Voltage Reference Module operates independently of the comparator module. The output of the reference generator may be connected to the RA2 pin if the TRISA<2> bit is set and the VROE bit, VRCON<6>, is set. Enabling the Voltage Reference output onto the RA2 pin with an input signal present will increase current consumption. Connecting RA2 as a digital output with VREF enabled will also increase current consumption.

The RA2 pin can be used as a simple D/A output with limited drive capability. Due to the limited drive capability, a buffer must be used in conjunction with the Voltage Reference output for external connections to VREF. Figure 9-3 shows an example buffering technique.

FIGURE 9-3: VOLTAGE REFERENCE OUTPUT BUFFER EXAMPLE

## 10.0 SPECIAL FEATURES OF THE CPU

What sets a microcontroller apart from other processors are special circuits to deal with the needs of real time applications. The PIC16CE62X family has a host of such features intended to maximize system reliability, minimize cost through elimination of external components, provide power saving operating modes and offer code protection.

These are:

1. OSC selection
2. Reset
  - Power-on Reset (POR)
  - Power-up Timer (PWRT)
  - Oscillator Start-Up Timer (OST)
  - Brown-out Reset (BOR)
3. Interrupts
4. Watchdog Timer (WDT)
5. SLEEP
6. Code protection
7. ID Locations
8. In-circuit serial programming

The PIC16CE62X has a Watchdog Timer which is controlled by configuration bits. It runs off its own RC oscillator for added reliability. There are two timers that offer necessary delays on power-up. One is the Oscillator Start-up Timer (OST), intended to keep the chip in reset until the crystal oscillator is stable. The other is the Power-up Timer (PWRT), which provides a fixed delay of 72 ms (nominal) on power-up only, designed to keep the part in reset while the power supply stabilizes. There is also circuitry to reset the device if a brown-out occurs which provides at least a 72 ms reset. With these three functions on-chip, most applications need no external reset circuitry.

The SLEEP mode is designed to offer a very low current power-down mode. The user can wake-up from SLEEP through external reset, Watchdog Timer wake-up or through an interrupt. Several oscillator options are also made available to allow the part to fit the application. The RC oscillator option saves system cost while the LP crystal option saves power. A set of configuration bits are used to select various options.

# PIC16CE62X

## 10.1 Configuration Bits

The configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped in program memory location 2007h.

The user will note that address 2007h is beyond the user program memory space. In fact, it belongs to the special test/configuration memory space (2000h – 3FFFh), which can be accessed only during programming.

**FIGURE 10-1: CONFIGURATION WORD**

CP1	CP0(2)	CP1	CP0(2)	CP1	CP0(2)	—	BODE(1)	CP1	CP0(2)	PWRTE(1)	WDTE	F0SC1	F0SC0	CONFIG REGISTER:	Address

<p>Note 1: Enabling Brown-out Reset automatically enables Power-up Timer (PWRT) regardless of the value of bit PWRTE. Ensure the Power-up Timer is enabled anytime Brown-out Reset is enabled.</p> <p>2: All of the CP1:CP0 pairs have to be given the same value to enable the code protection scheme listed.</p>															

## 10.2 Oscillator Configurations

### 10.2.1 OSCILLATOR TYPES

The PIC16CE62X can be operated in four different oscillator options. The user can program two configuration bits (FOSC1 and FOSC0) to select one of these four modes:

- LP Low Power Crystal
- XT Crystal/Resonator
- HS High Speed Crystal/Resonator
- RC Resistor/Capacitor

### 10.2.2 CRYSTAL OSCILLATOR / CERAMIC RESONATORS

In XT, LP or HS modes a crystal or ceramic resonator is connected to the OSC1 and OSC2 pins to establish oscillation (Figure 10-2). The PIC16CE62X oscillator design requires the use of a parallel cut crystal. Use of a series cut crystal may give a frequency out of the crystal manufacturers specifications. When in XT, LP or HS modes, the device can have an external clock source to drive the OSC1 pin (Figure 10-3).

**FIGURE 10-2: CRYSTAL OPERATION (OR CERAMIC RESONATOR) (HS, XT OR LP OSC CONFIGURATION)**

**FIGURE 10-3: EXTERNAL CLOCK INPUT OPERATION (HS, XT OR LP OSC CONFIGURATION)**

**TABLE 10-1: CERAMIC RESONATORS, PIC16CE62X**

Ranges Tested:			
Mode	Freq	OSC1	OSC2
XT	455 kHz	68 - 100 pF	68 - 100 pF
	2.0 MHz	15 - 68 pF	15 - 68 pF
	4.0 MHz	15 - 68 pF	15 - 68 pF
HS	8.0 MHz	10 - 68 pF	10 - 68 pF
	16.0 MHz	10 - 22 pF	10 - 22 pF
These values are for design guidance only. See notes at bottom of page.			
Resonators Used:			
455 kHz	Panasonic EFO-A455K04B	± 0.3%	
2.0 MHz	Murata Erie CSA2.00MG	± 0.5%	
4.0 MHz	Murata Erie CSA4.00MG	± 0.5%	
8.0 MHz	Murata Erie CSA8.00MT	± 0.5%	
16.0 MHz	Murata Erie CSA16.00MX	± 0.5%	
All resonators used did not have built-in capacitors.			

**TABLE 10-2: CAPACITOR SELECTION FOR CRYSTAL OSCILLATOR, PIC16CE62X**

Osc Type	Crystal Freq	Cap. Range C1	Cap. Range C2
LP	32 kHz	33 pF	33 pF
	200 kHz	15 pF	15 pF
XT	200 kHz	47-68 pF	47-68 pF
	1 MHz	15 pF	15 pF
	4 MHz	15 pF	15 pF
HS	4 MHz	15 pF	15 pF
	8 MHz	15-33 pF	15-33 pF
	20 MHz	15-33 pF	15-33 pF
These values are for design guidance only. See notes at bottom of page.			
Crystals Used			
32 kHz	Epson C-001R32.768K-A	± 20 PPM	
200 kHz	STD XTL 200.000KHz	± 20 PPM	
1 MHz	ECS ECS-10-13-1	± 50 PPM	
4 MHz	ECS ECS-40-20-1	± 50 PPM	
8 MHz	EPSON CA-301 8.000M-C	± 30 PPM	
20 MHz	EPSON CA-301 20.000M-C	± 30 PPM	

1. Recommended values of C1 and C2 are identical to the ranges tested table.
2. Higher capacitance increases the stability of oscillator but also increases the start-up time.
3. Since each resonator/crystal has its own characteristics, the user should consult the resonator/crystal manufacturer for appropriate values of external components.
4. Rs may be required in HS mode as well as XT mode to avoid overdriving crystals with low drive level specification.

# PIC16CE62X

## 10.2.3 EXTERNAL CRYSTAL OSCILLATOR CIRCUIT

Either a prepackaged oscillator can be used or a simple oscillator circuit with TTL gates can be built. Prepackaged oscillators provide a wide operating range and better stability. A well-designed crystal oscillator will provide good performance with TTL gates. Two types of crystal oscillator circuits can be used; one with series resonance, or one with parallel resonance.

Figure 10-4 shows implementation of a parallel resonant oscillator circuit. The circuit is designed to use the fundamental frequency of the crystal. The 74AS04 inverter performs the 180° phase shift that a parallel oscillator requires. The 4.7 kΩ resistor provides the negative feedback for stability. The 10 kΩ potentiometers bias the 74AS04 in the linear region. This could be used for external oscillator designs.

**FIGURE 10-4: EXTERNAL PARALLEL RESONANT CRYSTAL OSCILLATOR CIRCUIT**

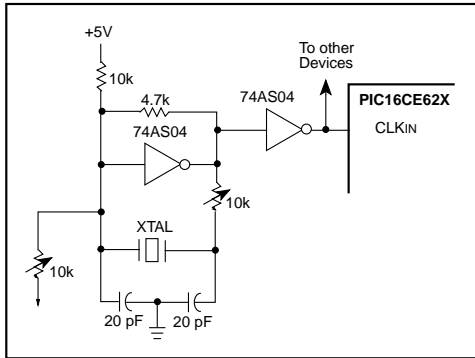

Figure 10-5 shows a series resonant oscillator circuit. This circuit is also designed to use the fundamental frequency of the crystal. The inverter performs a 180° phase shift in a series resonant oscillator circuit. The 330 kΩ resistors provide the negative feedback to bias the inverters in their linear region.

**FIGURE 10-5: EXTERNAL SERIES RESONANT CRYSTAL OSCILLATOR CIRCUIT**

## 10.2.4 RC OSCILLATOR

For timing insensitive applications the “RC” device option offers additional cost savings. The RC oscillator frequency is a function of the supply voltage, the resistor (Rext) and capacitor (Cext) values, and the operating temperature. In addition to this, the oscillator frequency will vary from unit to unit due to normal process parameter variation. Furthermore, the difference in lead frame capacitance between package types will also affect the oscillation frequency, especially for low Cext values. The user also needs to take into account variation due to tolerance of external R and C components used. Figure 10-6 shows how the R/C combination is connected to the PIC16CE62X. For Rext values below 2.2 kΩ, the oscillator operation may become unstable, or stop completely. For very high Rext values (e.g., 1 MΩ), the oscillator becomes sensitive to noise, humidity and leakage. Thus, we recommend to keep Rext between 3 kΩ and 100 kΩ.

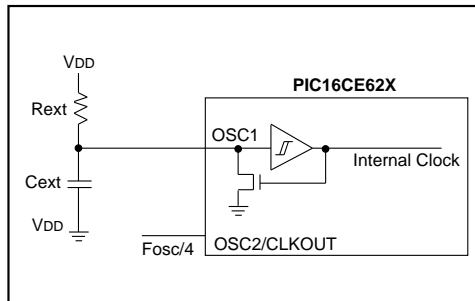

Although the oscillator will operate with no external capacitor (Cext = 0 pF), we recommend using values above 20 pF for noise and stability reasons. With no or small external capacitance, the oscillation frequency can vary dramatically due to changes in external capacitances, such as PCB trace capacitance or package lead frame capacitance.

See Section 14.0 for RC frequency variation from part to part due to normal process variation. The variation is larger for larger R (since leakage current variation will affect RC frequency more for large R) and for smaller C (since variation of input capacitance will affect RC frequency more).

See Section 14.0 for variation of oscillator frequency due to VDD for given Rext/Cext values as well as frequency variation due to operating temperature for given R, C, and VDD values.

The oscillator frequency, divided by 4, is available on the OSC2/CLKOUT pin, and can be used for test purposes or to synchronize other logic (Figure 3-2 for waveform).

**FIGURE 10-6: RC OSCILLATOR MODE**

## 10.3 Reset

The PIC16CE62X differentiates between various kinds of reset:

- a) Power-on reset (POR)
- b)  $\overline{\text{MCLR}}$  reset during normal operation
- c)  $\overline{\text{MCLR}}$  reset during SLEEP
- d) WDT reset (normal operation)
- e) WDT wake-up (SLEEP)
- f) Brown-out Reset (BOR)

Some registers are not affected in any reset condition; their status is unknown on POR and unchanged in any other reset. Most other registers are reset to a "reset

state" on Power-on reset, on  $\overline{\text{MCLR}}$  or WDT reset and on  $\overline{\text{MCLR}}$  reset during SLEEP. They are not affected by a WDT wake-up, since this is viewed as the resumption of normal operation.  $\overline{\text{TO}}$  and  $\overline{\text{PD}}$  bits are set or cleared differently in different reset situations as indicated in Table 10-4. These bits are used in software to determine the nature of the reset. See Table 10-6 for a full description of reset states of all registers.

A simplified block diagram of the on-chip reset circuit is shown in Figure 10-7.

The  $\overline{\text{MCLR}}$  reset path has a noise filter to detect and ignore small pulses. See Table 13-6 for pulse width specification.

**FIGURE 10-7: SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT**

# PIC16CE62X

## 10.4 Power-on Reset (POR), Power-up Timer (PWRT), Oscillator Start-up Timer (OST) and Brown-out Reset (BOR)

### 10.4.1 POWER-ON RESET (POR)

The on-chip POR circuit holds the chip in reset until VDD has reached a high enough level for proper operation. To take advantage of the POR, just tie the MCLR pin directly (or through a resistor) to VDD. This will eliminate external RC components usually needed to create Power-on Reset. A maximum rise time for VDD is required. See Electrical Specifications for details.

The POR circuit does not produce internal reset when VDD declines.

When the device starts normal operation (exits the reset condition), device operating parameters (voltage, frequency, temperature, etc.) must be met to ensure operation. If these conditions are not met, the device must be held in reset until the operating conditions are met.

For additional information, refer to Application Note AN607 "Power-up Trouble Shooting".

### 10.4.2 POWER-UP TIMER (PWRT)

The Power-up Timer provides a fixed 72 ms (nominal) time-out on power-up only, from POR or Brown-out Reset. The Power-up Timer operates on an internal RC oscillator. The chip is kept in reset as long as PWRT is active. The PWRT delay allows the VDD to rise to an acceptable level. A configuration bit, PWRTE can

disable (if set) or enable (if cleared or programmed) the Power-up Timer. The Power-up Timer should always be enabled when Brown-out Reset is enabled.

The Power-Up Time delay will vary from chip to chip and due to VDD, temperature and process variation. See DC parameters for details.

### 10.4.3 OSCILLATOR START-UP TIMER (OST)

The Oscillator Start-Up Timer (OST) provides a 1024 oscillator cycle (from OSC1 input) delay after the PWRT delay is over. This ensures that the crystal oscillator or resonator has started and stabilized.

The OST time-out is invoked only for XT, LP and HS modes and only on power-on reset or wake-up from SLEEP.

### 10.4.4 BROWN-OUT RESET (BOR)

The PIC16CE62X members have on-chip Brown-out Reset circuitry. A configuration bit, BODEN, can disable (if clear/programmed) or enable (if set) the Brown-out Reset circuitry. If VDD falls below 4.0V (refer to BVDD parameter D005) for greater than parameter (TBOR) in Table 13-6, the brown-out situation will reset the chip. A reset is not guaranteed to occur if VDD falls below 4.0V for less than parameter (TBOR). The chip will remain in Brown-out Reset until VDD rises above BVDD. The Power-up Timer will now be invoked and will keep the chip in reset an additional 72 ms. If VDD drops below BVDD while the Power-up Timer is running, the chip will go back into a Brown-out Reset and the Power-up Timer will be initialized. Once VDD rises above BVDD, the Power-up Timer will execute a 72 ms reset. The Power-up Timer should always be enabled when Brown-out Reset is enabled. Figure 10-8 shows typical Brown-out situations.

FIGURE 10-8: BROWN-OUT SITUATIONS

## 10.4.5 TIME-OUT SEQUENCE

On power-up the time-out sequence is as follows: First PWRT time-out is invoked after POR has expired. Then OST is activated. The total time-out will vary based on oscillator configuration and  $\overline{\text{PWRTE}}$  bit status. For example, in RC mode with  $\overline{\text{PWRTE}}$  bit erased ( $\overline{\text{PWRT}}$  disabled), there will be no time-out at all. Figure 10-9, Figure 10-10 and Figure 10-11 depict time-out sequences.

Since the time-outs occur from the POR pulse, if  $\overline{\text{MCLR}}$  is kept low long enough, the time-outs will expire. Then bringing  $\overline{\text{MCLR}}$  high will begin execution immediately (see Figure 10-10). This is useful for testing purposes or to synchronize more than one PICmicro device operating in parallel.

Table 10-5 shows the reset conditions for some special registers, while Table 10-6 shows the reset conditions for all the registers.

## 10.4.6 POWER CONTROL (PCON)/STATUS REGISTER

The power control/status register, PCON (address 8Eh) has two bits.

Bit0 is  $\overline{\text{BO}}$  (Brown-out).  $\overline{\text{BO}}$  is unknown on power-on-reset. It must then be set by the user and checked on subsequent resets to see if  $\overline{\text{BO}} = 0$  indicating that a brown-out has occurred. The  $\overline{\text{BO}}$  status bit is a don't care and is not necessarily predictable if the brown-out circuit is disabled (by setting BODEN bit = 0 in the Configuration word).

Bit1 is  $\overline{\text{POR}}$  (Power-on-reset). It is a '0' on power-on-reset and unaffected otherwise. The user must write a '1' to this bit following a power-on-reset. On a subsequent reset if  $\overline{\text{POR}}$  is '0', it will indicate that a power-on-reset must have occurred (VDD may have gone too low).

**TABLE 10-3: TIME-OUT IN VARIOUS SITUATIONS**

Oscillator Configuration	Power-up		Brown-out Reset	Wake-up from SLEEP
	$\overline{\text{PWRTE}} = 0$	$\overline{\text{PWRTE}} = 1$		
XT, HS, LP	72 ms + 1024 Tosc	1024 Tosc	72 ms + 1024 Tosc	1024 Tosc
RC	72 ms	—	72 ms	—

**TABLE 10-4: STATUS/PCON BITS AND THEIR SIGNIFICANCE**

POR	BOR	$\overline{\text{TO}}$	$\overline{\text{PD}}$	
0	X	1	1	Power-on-reset
0	X	0	X	Illegal, $\overline{\text{TO}}$ is set on $\overline{\text{POR}}$
0	X	X	0	Illegal, $\overline{\text{PD}}$ is set on $\overline{\text{POR}}$
1	0	X	X	Brown-out Reset
1	1	0	1	WDT Reset
1	1	0	0	WDT Wake-up
1	1	u	u	$\overline{\text{MCLR}}$ reset during normal operation
1	1	1	0	$\overline{\text{MCLR}}$ reset during SLEEP

## 10.5 Interrupts

The PIC16CE62X has 4 sources of interrupt:

- External interrupt RB0/INT
- TMR0 overflow interrupt
- PortB change interrupts (pins RB7:RB4)
- Comparator interrupt

The interrupt control register (INTCON) records individual interrupt requests in flag bits. It also has individual and global interrupt enable bits.

A global interrupt enable bit, GIE (INTCON<7>) enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. Individual interrupts can be disabled through their corresponding enable bits in INTCON register. GIE is cleared on reset.

The "return from interrupt" instruction, RETFIE, exits interrupt routine as well as sets the GIE bit, which re-enable RB0/INT interrupts.

The INT pin interrupt, the RB port change interrupt and the TMR0 overflow interrupt flags are contained in the INTCON register.

The peripheral interrupt flag is contained in the special register PIR1. The corresponding interrupt enable bit is contained in special registers PIE1.

When an interrupt is responded to, the GIE is cleared to disable any further interrupt, the return address is pushed into the stack and the PC is loaded with 0004h. Once in the interrupt service routine the source(s) of

the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid RB0/INT recursive interrupts.

For external interrupt events, such as the INT pin or PORTB change interrupt, the interrupt latency will be three or four instruction cycles. The exact latency depends when the interrupt event occurs (Figure 10-16). The latency is the same for one or two cycle instructions. Once in the interrupt service routine the source(s) of the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid multiple interrupt requests. Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

**Note 1:** Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

**2:** When an instruction that clears the GIE bit is executed, any interrupts that were pending for execution in the next cycle are ignored. The CPU will execute a NOP in the cycle immediately following the instruction which clears the GIE bit. The interrupts which were ignored are still pending to be serviced when the GIE bit is set again.

**FIGURE 10-15: INTERRUPT LOGIC**

# PIC16CE62X

## 10.5.1 RB0/INT INTERRUPT

External interrupt on RB0/INT pin is edge triggered: either rising if INTEDG bit (OPTION<6>) is set, or falling, if INTEDG bit is clear. When a valid edge appears on the RB0/INT pin, the INTF bit (INTCON<1>) is set. This interrupt can be disabled by clearing the INTE control bit (INTCON<4>). The INTF bit must be cleared in software in the interrupt service routine before re-enabling this interrupt. The RB0/INT interrupt can wake-up the processor from SLEEP, if the INTE bit was set prior to going into SLEEP. The status of the GIE bit decides whether or not the processor branches to the interrupt vector following wake-up. See Section 10.8 for details on SLEEP and Figure 10-19 for timing of wake-up from SLEEP through RB0/INT interrupt.

## 10.5.2 TMR0 INTERRUPT

An overflow (FFh → 00h) in the TMR0 register will set the TOIF (INTCON<2>) bit. The interrupt can be enabled/disabled by setting/clearing TOIE (INTCON<5>) bit. For operation of the Timer0 module, see Section 7.0.

## 10.5.3 PORTB INTERRUPT

An input change on PORTB <7:4> sets the RBIF (INTCON<0>) bit. The interrupt can be enabled/disabled by setting/clearing the RBIE (INTCON<4>) bit. For operation of PORTB (Section 5.2).

**Note:** If a change on the I/O pin should occur when the read operation is being executed (start of the Q2 cycle), then the RBIF interrupt flag may not get set.

## 10.5.4 COMPARATOR INTERRUPT

See Section 8.6 for complete description of comparator interrupts.

**FIGURE 10-16: INT PIN INTERRUPT TIMING**

## 10.6 Context Saving During Interrupts

During an interrupt, only the return PC value is saved on the stack. Typically, users may wish to save key registers during an interrupt e.g. W register and STATUS register. This will have to be implemented in software.

Example 10-1 stores and restores the STATUS and W registers. The user register, W\_TEMP, must be defined in both banks and must be defined at the same offset from the bank base address (i.e., W\_TEMP is defined at 0x70 in Bank 0 and it must also be defined at 0xF0 in Bank 1). The user register, STATUS\_TEMP, must be defined in Bank 0. The Example 10-1:

- Stores the W register
- Stores the STATUS register in Bank 0
- Executes the ISR code
- Restores the STATUS (and bank select bit register)
- Restores the W register

### EXAMPLE 10-1: SAVING THE STATUS AND W REGISTERS IN RAM

```

MOVWF  W_TEMP      ;copy W to temp register,
                   ;could be in either bank

SWAPF  STATUS,W    ;swap status to be saved into W
BCF    STATUS,RP0  ;change to bank 0 regardless
                   ;of current bank

MOVWF  STATUS_TEMP ;save status to bank 0
                   ;register
:
: (ISR)
:
SWAPF  STATUS_TEMP,W ;swap STATUS_TEMP register
                   ;into W, sets bank to original
                   ;state

MOVWF  STATUS      ;move W into STATUS register
SWAPF  W_TEMP,F    ;swap W_TEMP
SWAPF  W_TEMP,W    ;swap W_TEMP into W
    
```

## 10.7 Watchdog Timer (WDT)

The watchdog timer is a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the CLKIN pin. That means that the WDT will run, even if the clock on the OSC1 and OSC2 pins of the device has been stopped, for example, by execution of a SLEEP instruction. During normal operation, a WDT time-out generates a device RESET. If the device is in SLEEP mode, a WDT time-out causes the device to wake-up and continue with normal operation. The WDT can be permanently disabled by programming the configuration bit WDTE as clear (Section 10.1).

### 10.7.1 WDT PERIOD

The WDT has a nominal time-out period of 18 ms, (with no prescaler). The time-out periods vary with temperature, VDD and process variations from part to part (see DC specs). If longer time-out periods are desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT under software control by writing to the OPTION register. Thus, time-out periods up to 2.3 seconds can be realized.

The CLRWDT and SLEEP instructions clear the WDT and the postscaler, if assigned to the WDT, and prevent it from timing out and generating a device RESET.

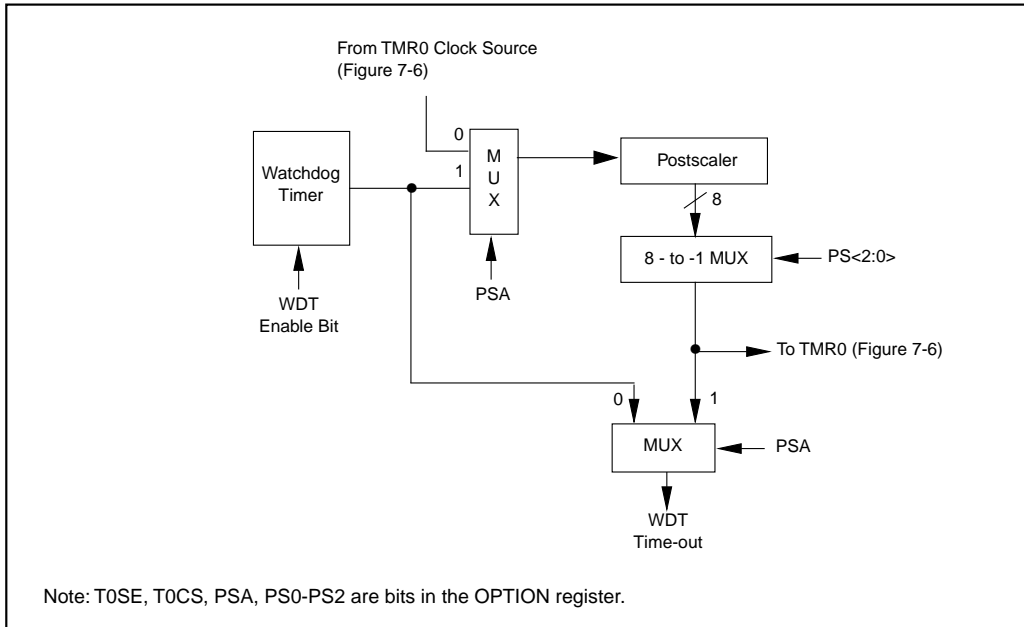

The  $\overline{TO}$  bit in the STATUS register will be cleared upon a Watchdog Timer time-out.

### 10.7.2 WDT PROGRAMMING CONSIDERATIONS

It should also be taken in account that under worst case conditions (VDD = Min., Temperature = Max., max. WDT prescaler) it may take several seconds before a WDT time-out occurs.

# PIC16CE62X

**FIGURE 10-18: SUMMARY OF WATCHDOG TIMER REGISTERS**

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
2007h	Config. bits	---	BODEN	CP1	CP0	PWRTE	WDTE	FOSC1	FOSC0
81h	OPTION	RBPU	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0

Legend: Shaded cells are not used by the Watchdog Timer.

**Note:** - = Unimplemented location, read as "0"  
 + = Reserved for future use

## 10.8 Power-Down Mode (SLEEP)

The Power-down mode is entered by executing a SLEEP instruction.

If enabled, the Watchdog Timer will be cleared but keeps running, the  $\overline{PD}$  bit in the STATUS register is cleared, the  $\overline{TO}$  bit is set, and the oscillator driver is turned off. The I/O ports maintain the status they had, before SLEEP was executed (driving high, low, or hi-impedance).

For lowest current consumption in this mode, all I/O pins should be either at VDD, or VSS, with no external circuitry drawing current from the I/O pin and the comparators and VREF should be disabled. I/O pins that are hi-impedance inputs should be pulled high or low externally to avoid switching currents caused by floating inputs. The TOCKI input should also be at VDD or VSS for lowest current consumption. The contribution from on chip pull-ups on PORTB should be considered.

The MCLR pin must be at a logic high level (VIHMC).

**Note:** It should be noted that a RESET generated by a WDT time-out does not drive MCLR pin low.

The first event will cause a device reset. The two latter events are considered a continuation of program execution. The  $\overline{TO}$  and  $\overline{PD}$  bits in the STATUS register can be used to determine the cause of device reset.  $\overline{PD}$  bit, which is set on power-up is cleared when SLEEP is invoked.  $\overline{TO}$  bit is cleared if WDT Wake-up occurred.

When the SLEEP instruction is being executed, the next instruction (PC + 1) is pre-fetched. For the device to wake-up through an interrupt event, the corresponding interrupt enable bit must be set (enabled). Wake-up is regardless of the state of the GIE bit. If the GIE bit is clear (disabled), the device continues execution at the instruction after the SLEEP instruction. If the GIE bit is set (enabled), the device executes the instruction after the SLEEP instruction and then branches to the interrupt address (0004h). In cases where the execution of the instruction following SLEEP is not desirable, the user should have a NOP after the SLEEP instruction.

**Note:** If the global interrupts are disabled (GIE is cleared), but any interrupt source has both its interrupt enable bit and the corresponding interrupt flag bits set, the device will immediately wakeup from sleep. The sleep instruction is completely executed.

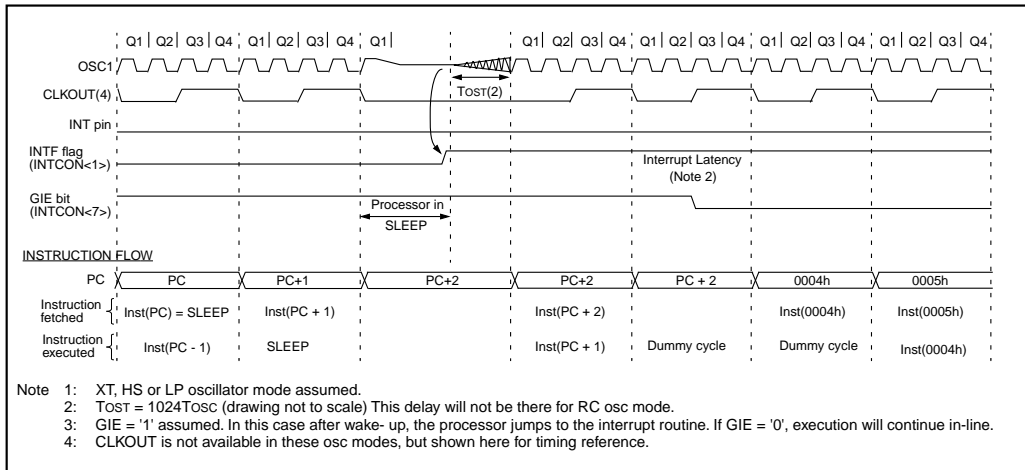

### 10.8.1 WAKE-UP FROM SLEEP

The device can wake-up from SLEEP through one of the following events:

1. External reset input on  $\overline{MCLR}$  pin
2. Watchdog Timer Wake-up (if WDT was enabled)
3. Interrupt from RB0/INT pin, RB Port change, or the Peripheral Interrupt (Comparator).

The WDT is cleared when the device wakes-up from sleep, regardless of the source of wake-up.

**FIGURE 10-19: WAKE-UP FROM SLEEP THROUGH INTERRUPT**

# PIC16CE62X

## 10.9 Code Protection

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

**Note:** Microchip does not recommend code protecting windowed devices.

## 10.10 ID Locations

Four memory locations (2000h-2003h) are designated as ID locations where the user can store checksum or other code-identification numbers. These locations are not accessible during normal execution but are readable and writable during program/verify. Only the least significant 4 bits of the ID locations are used.

## 10.11 In-Circuit Serial Programming

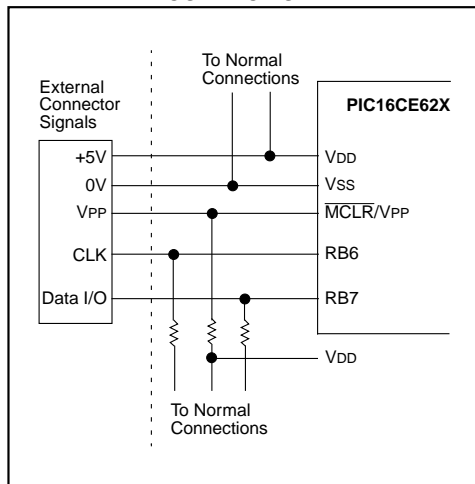

The PIC16CE62X microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground, and the programming voltage. This allows customers to manufacture boards with unprogrammed devices, and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

The device is placed into a program/verify mode by holding the RB6 and RB7 pins low while raising the MCLR (VPP) pin from VIL to VIH (see programming specification). RB6 becomes the programming clock and RB7 becomes the programming data. Both RB6 and RB7 are Schmitt Trigger inputs in this mode.

After reset, to place the device into programming/verify mode, the program counter (PC) is at location 00h. A 6-bit command is then supplied to the device. Depending on the command, 14-bits of program data are then supplied to or from the device, depending if the command was a load or a read. For complete details of serial programming, please refer to the PIC16C6X/7X/9XX Programming Specifications (Literature #DS30228).

A typical in-circuit serial programming connection is shown in Figure 10-20.

**FIGURE 10-20: TYPICAL IN-CIRCUIT SERIAL PROGRAMMING CONNECTION**

## 11.0 INSTRUCTION SET SUMMARY

Each PIC16CE62X instruction is a 14-bit word divided into an OPCODE which specifies the instruction type and one or more operands which further specify the operation of the instruction. The PIC16CE62X instruction set summary in Table 11-2 lists **byte-oriented**, **bit-oriented**, and **literal and control** operations. Table 11-1 shows the opcode field descriptions.

For **byte-oriented** instructions, 'f' represents a file register designator and 'd' represents a destination designator. The file register designator specifies which file register is to be used by the instruction.

The destination designator specifies where the result of the operation is to be placed. If 'd' is zero, the result is placed in the W register. If 'd' is one, the result is placed in the file register specified in the instruction.

For **bit-oriented** instructions, 'b' represents a bit field designator which selects the number of the bit affected by the operation, while 'f' represents the number of the file in which the bit is located.

For **literal and control** operations, 'k' represents an eight or eleven bit constant or literal value.

**TABLE 11-1: OPCODE FIELD DESCRIPTIONS**

Field	Description
f	Register file address (0x00 to 0x7F)
w	Working register (accumulator)
b	Bit address within an 8-bit file register
k	Literal field, constant data or label
x	Don't care location (= 0 or 1) The assembler will generate code with x = 0. It is the recommended form of use for compatibility with all Microchip software tools.
d	Destination select; d = 0: store result in W, d = 1: store result in file register f. Default is d = 1
label	Label name
TOS	Top of Stack
PC	Program Counter
PCLATH	Program Counter High Latch
GIE	Global Interrupt Enable bit
WDT	Watchdog Timer/Counter
TO	Time-out bit
PD	Power-down bit
dest	Destination either the W register or the specified register file location
[ ]	Options
( )	Contents
→	Assigned to
<>	Register bit field
∈	In the set of
<i>italics</i>	User defined term (font is courier)

The instruction set is highly orthogonal and is grouped into three basic categories:

- **Byte-oriented** operations
- **Bit-oriented** operations
- **Literal and control** operations

All instructions are executed within one single instruction cycle, unless a conditional test is true or the program counter is changed as a result of an instruction. In this case, the execution takes two instruction cycles with the second cycle executed as a NOP. One instruction cycle consists of four oscillator periods. Thus, for an oscillator frequency of 4 MHz, the normal instruction execution time is 1 μs. If a conditional test is true or the program counter is changed as a result of an instruction, the instruction execution time is 2 μs.

Table 11-1 lists the instructions recognized by the MPASM assembler.

Figure 11-1 shows the three general formats that the instructions can have.

**Note:** To maintain upward compatibility with future PICmicro™ products, do not use the `OPTION` and `TRIS` instructions.

All examples use the following format to represent a hexadecimal number:

0xhh

where h signifies a hexadecimal digit.

**FIGURE 11-1: GENERAL FORMAT FOR INSTRUCTIONS**

# PIC16CE62X

<b>LITERAL AND CONTROL OPERATIONS</b>								
<b>ADDLW</b>	<b>k</b> Add literal and W	1	11	111x	kkkk	kkkk	C,DC,Z	
<b>ANDLW</b>	<b>k</b> AND literal with W	1	11	1001	kkkk	kkkk	Z	
<b>CALL</b>	<b>k</b> Call subroutine	2	10	0kkk	kkkk	kkkk		
<b>CLRWDT</b>	<b>-</b> Clear Watchdog Timer	1	00	0000	0110	0100	$\overline{TO}, \overline{PD}$	
<b>GOTO</b>	<b>k</b> Go to address	2	10	1kkk	kkkk	kkkk		
<b>IORLW</b>	<b>k</b> Inclusive OR literal with W	1	11	1000	kkkk	kkkk	Z	
<b>MOVLW</b>	<b>k</b> Move literal to W	1	11	00xx	kkkk	kkkk		
<b>RETFIE</b>	<b>-</b> Return from interrupt	2	00	0000	0000	1001		
<b>RETLW</b>	<b>k</b> Return with literal in W	2	11	01xx	kkkk	kkkk		
<b>RETURN</b>	<b>-</b> Return from Subroutine	2	00	0000	0000	1000		
<b>SLEEP</b>	<b>-</b> Go into standby mode	1	00	0000	0110	0011	$\overline{TO}, \overline{PD}$	
<b>SUBLW</b>	<b>k</b> Subtract W from literal	1	11	110x	kkkk	kkkk	C,DC,Z	
<b>XORLW</b>	<b>k</b> Exclusive OR literal with W	1	11	1010	kkkk	kkkk	Z	

- Note 1: When an I/O register is modified as a function of itself (e.g., `MOVF PORTB, 1`), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.
- 2: If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.
- 3: If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a NOP.

## 11.1 Instruction Descriptions

### ADDLW Add Literal and W

Syntax: `[ label ] ADDLW k`

Operands:  $0 \leq k \leq 255$

Operation:  $(W) + k \rightarrow (W)$

Status Affected: C, DC, Z

Encoding: 

11	111x	kkkk	kkkk
----	------	------	------

Description: The contents of the W register are added to the eight bit literal 'k' and the result is placed in the W register.

Words: 1

Cycles: 1

Example `ADDLW 0x15`

Before Instruction  
W = 0x10

After Instruction  
W = 0x25

### ANDLW AND Literal with W

Syntax: `[ label ] ANDLW k`

Operands:  $0 \leq k \leq 255$

Operation:  $(W) .AND. (k) \rightarrow (W)$

Status Affected: Z

Encoding: 

11	1001	kkkk	kkkk
----	------	------	------

Description: The contents of W register are AND'ed with the eight bit literal 'k'. The result is placed in the W register.

Words: 1

Cycles: 1

Example `ANDLW 0x5F`

Before Instruction  
W = 0xA3

After Instruction  
W = 0x03

### ADDWF Add W and f

Syntax: `[ label ] ADDWF f,d`

Operands:  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:  $(W) + (f) \rightarrow (dest)$

Status Affected: C, DC, Z

Encoding: 

00	0111	dfff	ffff
----	------	------	------

Description: Add the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example `ADDWF FSR, 0`

Before Instruction  
W = 0x17  
FSR = 0xC2

After Instruction  
W = 0xD9  
FSR = 0xC2

### ANDWF AND W with f

Syntax: `[ label ] ANDWF f,d`

Operands:  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:  $(W) .AND. (f) \rightarrow (dest)$

Status Affected: Z

Encoding: 

00	0101	dfff	ffff
----	------	------	------

Description: AND the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example `ANDWF FSR, 1`

Before Instruction  
W = 0x17  
FSR = 0xC2

After Instruction  
W = 0x17  
FSR = 0x02

# PIC16CE62X

## BCF Bit Clear f

Syntax: [ *label* ] BCF f,b

Operands:  $0 \leq f \leq 127$   
 $0 \leq b \leq 7$

Operation:  $0 \rightarrow (f<b>)$

Status Affected: None

Encoding: 

01	00bb	bfff	ffff
----	------	------	------

Description: Bit 'b' in register 'f' is cleared.

Words: 1

Cycles: 1

Example      BCF      FLAG\_REG, 7

Before Instruction  
                FLAG\_REG = 0xC7  
After Instruction  
                FLAG\_REG = 0x47

## BTFSC Bit Test, Skip if Clear

Syntax: [ *label* ] BTFSC f,b

Operands:  $0 \leq f \leq 127$   
 $0 \leq b \leq 7$

Operation: skip if (f<b>) = 0

Status Affected: None

Encoding: 

01	10bb	bfff	ffff
----	------	------	------

Description: If bit 'b' in register 'f' is '0' then the next instruction is skipped.  
If bit 'b' is '0' then the next instruction fetched during the current instruction execution is discarded, and a NOP is executed instead, making this a two-cycle instruction.

Words: 1

Cycles: 1(2)

Example      HERE    BTFSC    FLAG,1  
                FALSE    GOTO    PROCESS\_CODE  
                TRUE     :  
                          :  
                          :

Before Instruction  
                PC =   address   HERE  
After Instruction  
                if FLAG<1> = 0,  
                  PC =   address   TRUE  
                if FLAG<1>=1,  
                  PC =   address   FALSE

## BSF Bit Set f

Syntax: [ *label* ] BSF f,b

Operands:  $0 \leq f \leq 127$   
 $0 \leq b \leq 7$

Operation:  $1 \rightarrow (f<b>)$

Status Affected: None

Encoding: 

01	01bb	bfff	ffff
----	------	------	------

Description: Bit 'b' in register 'f' is set.

Words: 1

Cycles: 1

Example      BSF      FLAG\_REG, 7

Before Instruction  
                FLAG\_REG = 0x0A  
After Instruction  
                FLAG\_REG = 0x8A

## **BTFSS**      **Bit Test f, Skip if Set**

**Syntax:**      [ *label* ] BTFSS f,b

**Operands:**     $0 \leq f \leq 127$   
 $0 \leq b < 7$

**Operation:**    skip if (f<b>) = 1

**Status Affected:** None

**Encoding:**

01	11bb	bfff	ffff
----	------	------	------

**Description:** If bit 'b' in register 'f' is '1' then the next instruction is skipped.  
 If bit 'b' is '1', then the next instruction fetched during the current instruction execution, is discarded and a NOP is executed instead, making this a two-cycle instruction.

**Words:**        1

**Cycles:**       1(2)

**Example**

```

HERE   BTFSS  FLAG,1
FALSE  GOTO  PROCESS_CODE
TRUE   .
        .
        .
  
```

**Before Instruction**  
 PC = address HERE

**After Instruction**  
 if FLAG<1> = 0,  
 PC = address FALSE  
 if FLAG<1> = 1,  
 PC = address TRUE

## **CALL**        **Call Subroutine**

**Syntax:**       [ *label* ] CALL k

**Operands:**     $0 \leq k \leq 2047$

**Operation:**    (PC)+ 1 → TOS,  
 k → PC<10:0>,  
 (PCLATH<4:3>) → PC<12:11>

**Status Affected:** None

**Encoding:**

10	0kkk	kkkk	kkkk
----	------	------	------

**Description:** Call Subroutine. First, return address (PC+1) is pushed onto the stack. The eleven bit immediate address is loaded into PC bits <10:0>. The upper bits of the PC are loaded from PCLATH. CALL is a two-cycle instruction.

**Words:**        1

**Cycles:**       2

**Example**

```

HERE   CALL  THERE
  
```

**Before Instruction**  
 PC = Address HERE

**After Instruction**  
 PC = Address THERE  
 TOS = Address HERE+1

## **CLRF**         **Clear f**

**Syntax:**       [ *label* ] CLRF f

**Operands:**     $0 \leq f \leq 127$

**Operation:**    00h → (f)  
 1 → Z

**Status Affected:** Z

**Encoding:**

00	0001	1fff	ffff
----	------	------	------

**Description:** The contents of register 'f' are cleared and the Z bit is set.

**Words:**        1

**Cycles:**       1

**Example**

CLRF      FLAG\_REG

**Before Instruction**  
 FLAG\_REG = 0x5A

**After Instruction**  
 FLAG\_REG = 0x00  
 Z = 1

## **CLRW**        **Clear W**

**Syntax:**       [ *label* ] CLRW

**Operands:**    None

**Operation:**    00h → (W)  
 1 → Z

**Status Affected:** Z

**Encoding:**

00	0001	0xxx	xxxx
----	------	------	------

**Description:** W register is cleared. Zero bit (Z) is set.

**Words:**        1

**Cycles:**       1

**Example**

CLRW

**Before Instruction**  
 W = 0x5A

**After Instruction**  
 W = 0x00  
 Z = 1

# PIC16CE62X

## CLRWDT **Clear Watchdog Timer**

Syntax: [label] CLRWDT

Operands: None

Operation: 00h → WDT  
0 → WDT prescaler,  
1 → TO  
1 → PD

Status Affected:  $\overline{TO}$ ,  $\overline{PD}$

Encoding: 

00	0000	0110	0100
----	------	------	------

Description: CLRWDT instruction resets the Watchdog Timer. It also resets the prescaler of the WDT. Status bits  $\overline{TO}$  and  $\overline{PD}$  are set.

Words: 1

Cycles: 1

Example CLRWDT

Before Instruction  
WDT counter = ?

After Instruction  
WDT counter = 0x00  
WDT prescaler = 0  
 $\overline{TO}$  = 1  
 $\overline{PD}$  = 1

## COMF **Complement f**

Syntax: [label] COMF f,d

Operands:  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation: (f) → (dest)

Status Affected: Z

Encoding: 

00	1001	dfff	ffff
----	------	------	------

Description: The contents of register 'f' are complemented. If 'd' is 0 the result is stored in W. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example COMF REG1,0

Before Instruction  
REG1 = 0x13

After Instruction  
REG1 = 0x13  
W = 0xEC

## DECf **Decrement f**

Syntax: [label] DECf f,d

Operands:  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation: (f) - 1 → (dest)

Status Affected: Z

Encoding: 

00	0011	dfff	ffff
----	------	------	------

Description: Decrement register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example DECf CNT, 1

Before Instruction  
CNT = 0x01  
Z = 0

After Instruction  
CNT = 0x00  
Z = 1

## DECFSZ **Decrement f, Skip if 0**

Syntax: [label] DECFSZ f,d

Operands:  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation: (f) - 1 → (dest); skip if result = 0

Status Affected: None

Encoding: 

00	1011	dfff	ffff
----	------	------	------

Description: The contents of register 'f' are decremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 0, the next instruction, which is already fetched, is discarded. A NOP is executed instead making it a two-cycle instruction.

Words: 1

Cycles: 1(2)

Example

```
HERE      DECFSZ  CNT, 1
          GOTO    LOOP
CONTINUE  .
          .
          .
```

Before Instruction  
PC = address HERE

After Instruction  
CNT = CNT - 1  
if CNT = 0,  
PC = address CONTINUE  
if CNT ≠ 0,  
PC = address HERE+1

**GOTO**                    **Unconditional Branch**

Syntax:                    `[ label ] GOTO k`

Operands:                  $0 \leq k \leq 2047$

Operation:                 $k \rightarrow PC<10:0>$   
 $PCLATH<4:3> \rightarrow PC<12:11>$

Status Affected:        None

Encoding:                 

10	1kkk	kkkk	kkkk
----	------	------	------

Description:             GOTO is an unconditional branch. The eleven bit immediate value is loaded into PC bits <10:0>. The upper bits of PC are loaded from PCLATH<4:3>. GOTO is a two-cycle instruction.

Words:                    1

Cycles:                    2

Example                    `GOTO THERE`

After Instruction  
                               `PC = Address THERE`

**INCFSZ**                   **Increment f, Skip if 0**

Syntax:                    `[ label ] INCFSZ f,d`

Operands:                  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:                 $(f) + 1 \rightarrow (\text{dest})$ , skip if result = 0

Status Affected:        None

Encoding:                 

00	1111	dfff	ffff
----	------	------	------

Description:             The contents of register 'f' are incremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 0, the next instruction, which is already fetched, is discarded. A NOP is executed instead making it a two-cycle instruction.

Words:                    1

Cycles:                    1(2)

Example                    `HERE            INCFSZ            CNT, 1`  
                               `GOTO            LOOP`  
                               `CONTINUE     •`  
                               `•`  
                               `•`

Before Instruction  
                               `PC = address HERE`

After Instruction  
                               `CNT = CNT + 1`  
                               if CNT= 0,  
                               `PC = address CONTINUE`  
                               if CNT≠ 0,  
                               `PC = address HERE +1`

**INCF**                    **Increment f**

Syntax:                    `[ label ] INCF f,d`

Operands:                  $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:                 $(f) + 1 \rightarrow (\text{dest})$

Status Affected:        Z

Encoding:                 

00	1010	dfff	ffff
----	------	------	------

Description:             The contents of register 'f' are incremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.

Words:                    1

Cycles:                    1

Example                    `INCF    CNT, 1`

Before Instruction  
                               `CNT = 0xFF`  
                               `Z = 0`

After Instruction  
                               `CNT = 0x00`  
                               `Z = 1`

**IORLW**                   **Inclusive OR Literal with W**

Syntax:                    `[ label ] IORLW k`

Operands:                  $0 \leq k \leq 255$

Operation:                 $(W) .OR. k \rightarrow (W)$

Status Affected:        Z

Encoding:                 

11	1000	kkkk	kkkk
----	------	------	------

Description:             The contents of the W register is OR'ed with the eight bit literal 'k'. The result is placed in the W register.

Words:                    1

Cycles:                    1

Example                    `IORLW    0x35`

Before Instruction  
                               `W = 0x9A`

After Instruction  
                               `W = 0xBF`  
                               `Z = 1`

# PIC16CE62X

## IORWF **Inclusive OR W with f**

**Syntax:** [ *label* ] IORWF f,d

**Operands:**  $0 \leq f \leq 127$   
 $d \in [0,1]$

**Operation:** (W) .OR. (f) → (dest)

**Status Affected:** Z

**Encoding:**

00	0100	dfff	ffff
----	------	------	------

**Description:** Inclusive OR the W register with register 'f'. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.

**Words:** 1

**Cycles:** 1

**Example**

```

IORWF      RESULT, 0

Before Instruction
    RESULT = 0x13
     W     = 0x91

After Instruction
    RESULT = 0x13
     W     = 0x93
     Z     = 1
  
```

## MOVLW **Move Literal to W**

**Syntax:** [ *label* ] MOVLW k

**Operands:**  $0 \leq k \leq 255$

**Operation:** k → (W)

**Status Affected:** None

**Encoding:**

11	00xx	kkkk	kkkk
----	------	------	------

**Description:** The eight bit literal 'k' is loaded into W register. The don't cares will assemble as 0's.

**Words:** 1

**Cycles:** 1

**Example**

```

MOVLW    0x5A

After Instruction
    W     = 0x5A
  
```

## MOVF **Move f**

**Syntax:** [ *label* ] MOVF f,d

**Operands:**  $0 \leq f \leq 127$   
 $d \in [0,1]$

**Operation:** (f) → (dest)

**Status Affected:** Z

**Encoding:**

00	1000	dfff	ffff
----	------	------	------

**Description:** The contents of register f is moved to a destination dependant upon the status of d. If d = 0, destination is W register. If d = 1, the destination is file register f itself. d = 1 is useful to test a file register since status flag Z is affected.

**Words:** 1

**Cycles:** 1

**Example**

```

MOVF     FSR, 0

After Instruction
    W     = value in FSR register
    Z     = 1
  
```

## MOVWF **Move W to f**

**Syntax:** [ *label* ] MOVWF f

**Operands:**  $0 \leq f \leq 127$

**Operation:** (W) → (f)

**Status Affected:** None

**Encoding:**

00	0000	1fff	ffff
----	------	------	------

**Description:** Move data from W register to register 'f'.

**Words:** 1

**Cycles:** 1

**Example**

```

MOVWF    OPTION

Before Instruction
    OPTION = 0xFF
     W     = 0x4F

After Instruction
    OPTION = 0x4F
     W     = 0x4F
  
```

<b>NOP</b>	<b>No Operation</b>				
Syntax:	[ <i>label</i> ] NOP				
Operands:	None				
Operation:	No operation				
Status Affected:	None				
Encoding:	<table border="1"><tr><td>00</td><td>0000</td><td>0xxx0</td><td>0000</td></tr></table>	00	0000	0xxx0	0000
00	0000	0xxx0	0000		
Description:	No operation.				
Words:	1				
Cycles:	1				
Example	NOP				

<b>RETFIE</b>	<b>Return from Interrupt</b>				
Syntax:	[ <i>label</i> ] RETFIE				
Operands:	None				
Operation:	TOS → PC, 1 → GIE				
Status Affected:	None				
Encoding:	<table border="1"><tr><td>00</td><td>0000</td><td>0000</td><td>1001</td></tr></table>	00	0000	0000	1001
00	0000	0000	1001		
Description:	Return from Interrupt. Stack is POPed and Top of Stack (TOS) is loaded in the PC. Interrupts are enabled by setting Global Interrupt Enable bit, GIE (INTCON<7>). This is a two-cycle instruction.				
Words:	1				
Cycles:	2				
Example	RETFIE				
	After Interrupt				
	PC = TOS				
	GIE = 1				

<b>OPTION</b>	<b>Load Option Register</b>				
Syntax:	[ <i>label</i> ] OPTION				
Operands:	None				
Operation:	(W) → OPTION				
Status Affected:	None				
Encoding:	<table border="1"><tr><td>00</td><td>0000</td><td>0110</td><td>0010</td></tr></table>	00	0000	0110	0010
00	0000	0110	0010		
Description:	The contents of the W register are loaded in the OPTION register. This instruction is supported for code compatibility with PIC16C5X products. Since OPTION is a readable/writable register, the user can directly address it.				
Words:	1				
Cycles:	1				
Example					
	<b>To maintain upward compatibility with future PICmicro™ products, do not use this instruction.</b>				

<b>RETLW</b>	<b>Return with Literal in W</b>				
Syntax:	[ <i>label</i> ] RETLW k				
Operands:	0 ≤ k ≤ 255				
Operation:	k → (W); TOS → PC				
Status Affected:	None				
Encoding:	<table border="1"><tr><td>11</td><td>01xx</td><td>kkkk</td><td>kkkk</td></tr></table>	11	01xx	kkkk	kkkk
11	01xx	kkkk	kkkk		
Description:	The W register is loaded with the eight bit literal 'k'. The program counter is loaded from the top of the stack (the return address). This is a two-cycle instruction.				
Words:	1				
Cycles:	2				
Example	<pre>CALL TABLE      ;W contains table                   ;offset value                   ;W now has table • value • TABLE • ADDWF PC         ;W = offset RETLW k1        ;Begin table RETLW k2        ; • • RETLW kn        ; End of table</pre>				
	Before Instruction				
	W = 0x07				
	After Instruction				
	W = value of k8				

# PIC16CE62X

**RETURN**      **Return from Subroutine**

---

Syntax:      [ *label* ] RETURN

Operands:      None

Operation:      TOS → PC

Status Affected:      None

Encoding:      

00	0000	0000	1000
----	------	------	------

Description:      Return from subroutine. The stack is POPed and the top of the stack (TOS) is loaded into the program counter. This is a two cycle instruction.

Words:      1

Cycles:      2

Example

```

RETURN
After Interrupt
    PC = TOS
  
```

**RRF**      **Rotate Right f through Carry**

---

Syntax:      [ *label* ] RRF f,d

Operands:       $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:      See description below

Status Affected:      C

Encoding:      

00	1100	dfff	ffff
----	------	------	------

Description:      The contents of register 'f' are rotated one bit to the right through the Carry Flag. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.

Words:      1

Cycles:      1

Example

```

RRF    REG1,0
  
```

```

Before Instruction
REG1 = 1110 0110
C    = 0
After Instruction
REG1 = 1110 0110
W    = 0111 0011
C    = 0
  
```

**RLF**      **Rotate Left f through Carry**

---

Syntax:      [ *label* ] RLF f,d

Operands:       $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:      See description below

Status Affected:      C

Encoding:      

00	1101	dfff	ffff
----	------	------	------

Description:      The contents of register 'f' are rotated one bit to the left through the Carry Flag. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words:      1

Cycles:      1

Example

```

RLF    REG1,0
Before Instruction
REG1 = 1110 0110
C    = 0
After Instruction
REG1 = 1110 0110
W    = 1100 1100
C    = 1
  
```

**SLEEP**

---

Syntax:      [ *label* ] SLEEP

Operands:      None

Operation:      00h → WDT,  
0 → WDT prescaler,  
1 →  $\overline{TO}$ ,  
0 → PD

Status Affected:       $\overline{TO}$ , PD

Encoding:      

00	0000	0110	0011
----	------	------	------

Description:      The power-down status bit,  $\overline{PD}$  is cleared. Time-out status bit,  $\overline{TO}$  is set. Watchdog Timer and its prescaler are cleared. The processor is put into SLEEP mode with the oscillator stopped. See Section 10.8 for more details.

Words:      1

Cycles:      1

Example:      SLEEP

## **SUBLW**      **Subtract W from Literal**

Syntax:      [*label*]    SUBLW    *k*

Operands:     $0 \leq k \leq 255$

Operation:     $k - (W) \rightarrow (W)$

Status        C, DC, Z

Affected:

Encoding:

11	110x	kkkk	kkkk
----	------	------	------

Description:    The W register is subtracted (2's complement method) from the eight bit literal 'k'. The result is placed in the W register.

Words:        1

Cycles:        1

Example 1:    SUBLW    0x02

Before Instruction

W = 1  
C = ?

After Instruction

W = 1  
C = 1; result is positive

Example 2:    Before Instruction

W = 2  
C = ?

After Instruction

W = 0  
C = 1; result is zero

Example 3:    Before Instruction

W = 3  
C = ?

After Instruction

W = 0xFF  
C = 0; result is negative

## **SUBWF**      **Subtract W from f**

Syntax:      [*label*]    SUBWF    *f,d*

Operands:     $0 \leq f \leq 127$   
 $d \in [0,1]$

Operation:     $(f) - (W) \rightarrow (\text{dest})$

Status        C, DC, Z

Affected:

Encoding:

00	0010	dfff	fff
----	------	------	-----

Description:    Subtract (2's complement method)

W register from register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words:        1

Cycles:        1

Example 1:    SUBWF    REG1,1

Before Instruction

REG1 = 3  
W = 2  
C = ?

After Instruction

REG1 = 1  
W = 2  
C = 1; result is positive

Example 2:    Before Instruction

REG1 = 2  
W = 2  
C = ?

After Instruction

REG1 = 0  
W = 2  
C = 1; result is zero

Example 3:    Before Instruction

REG1 = 1  
W = 2  
C = ?

After Instruction

REG1 = 0xFF  
W = 2  
C = 0; result is negative

# PIC16CE62X

SWAPF	Swap Nibbles in f				
Syntax:	[ <i>label</i> ] SWAPF f,d				
Operands:	$0 \leq f \leq 127$ $d \in [0,1]$				
Operation:	(f<3:0>) → (dest<7:4>), (f<7:4>) → (dest<3:0>)				
Status Affected:	None				
Encoding:	<table border="1"> <tr> <td>00</td> <td>1110</td> <td>dfff</td> <td>ffff</td> </tr> </table>	00	1110	dfff	ffff
00	1110	dfff	ffff		
Description:	The upper and lower nibbles of register 'f' are exchanged. If 'd' is 0 the result is placed in W register. If 'd' is 1 the result is placed in register 'f'.				
Words:	1				
Cycles:	1				
Example	SWAPF REG, 0 Before Instruction REG1 = 0xA5 After Instruction REG1 = 0xA5 W = 0x5A				

XORLW	Exclusive OR Literal with W				
Syntax:	[ <i>label</i> ] XORLW k				
Operands:	$0 \leq k \leq 255$				
Operation:	(W) .XOR. k → (W)				
Status Affected:	Z				
Encoding:	<table border="1"> <tr> <td>11</td> <td>1010</td> <td>kkkk</td> <td>kkkk</td> </tr> </table>	11	1010	kkkk	kkkk
11	1010	kkkk	kkkk		
Description:	The contents of the W register are XOR'ed with the eight bit literal 'k'. The result is placed in the W register.				
Words:	1				
Cycles:	1				
Example:	XORLW 0xAF Before Instruction W = 0xB5 After Instruction W = 0x1A				

TRIS	Load TRIS Register				
Syntax:	[ <i>label</i> ] TRIS f				
Operands:	$5 \leq f \leq 7$				
Operation:	(W) → TRIS register f;				
Status Affected:	None				
Encoding:	<table border="1"> <tr> <td>00</td> <td>0000</td> <td>0110</td> <td>0fff</td> </tr> </table>	00	0000	0110	0fff
00	0000	0110	0fff		
Description:	The instruction is supported for code compatibility with the PIC16C5X products. Since TRIS registers are readable and writable, the user can directly address them.				
Words:	1				
Cycles:	1				
Example	<b>To maintain upward compatibility with future PICmicro™ products, do not use this instruction.</b>				

XORWF	Exclusive OR W with f				
Syntax:	[ <i>label</i> ] XORWF f,d				
Operands:	$0 \leq f \leq 127$ $d \in [0,1]$				
Operation:	(W) .XOR. (f) → (dest)				
Status Affected:	Z				
Encoding:	<table border="1"> <tr> <td>00</td> <td>0110</td> <td>dfff</td> <td>ffff</td> </tr> </table>	00	0110	dfff	ffff
00	0110	dfff	ffff		
Description:	Exclusive OR the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.				
Words:	1				
Cycles:	1				
Example	XORWF REG 1 Before Instruction REG = 0xAF W = 0xB5 After Instruction REG = 0x1A W = 0xB5				

## 12.0 DEVELOPMENT SUPPORT

### 12.1 Development Tools

The PICmicro™ microcontrollers are supported with a full range of hardware and software development tools:

- PICMASTER®/PICMASTER CE Real-Time In-Circuit Emulator
- ICEPIC™ Low-Cost PIC16C5X and PIC16CXXX In-Circuit Emulator
- PRO MATE® II Universal Programmer
- PICSTART® Plus Entry-Level Prototype Programmer
- PICDEM-1 Low-Cost Demonstration Board
- PICDEM-2 Low-Cost Demonstration Board
- PICDEM-3 Low-Cost Demonstration Board
- MPASM Assembler
- MPLAB™ SIM Software Simulator
- MPLAB-C17 (C Compiler)
- Fuzzy Logic Development System (fuzzyTECH®-MP)

### 12.2 PICMASTER: High Performance Universal In-Circuit Emulator with MPLAB IDE

The PICMASTER Universal In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for all microcontrollers in the PIC14C000, PIC12CXXX, PIC16C5X, PIC16CXXX and PIC17CXX families. PICMASTER is supplied with the MPLAB™ Integrated Development Environment (IDE), which allows editing, "make" and download, and source debugging from a single environment.

Interchangeable target probes allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the PICMASTER allows expansion to support all new Microchip microcontrollers.

The PICMASTER Emulator System has been designed as a real-time emulation system with advanced features that are generally found on more expensive development tools. The PC compatible 386 (and higher) machine platform and Microsoft Windows® 3.x environment were chosen to best make these features available to you, the end user.

A CE compliant version of PICMASTER is available for European Union (EU) countries.

### 12.3 ICEPIC: Low-Cost PICmicro™ In-Circuit Emulator

ICEPIC is a low-cost in-circuit emulator solution for the Microchip PIC12CXXX, PIC16C5X and PIC16CXXX families of 8-bit OTP microcontrollers.

ICEPIC is designed to operate on PC-compatible machines ranging from 286-AT® through Pentium™ based machines under Windows 3.x environment. ICEPIC features real time, non-intrusive emulation.

### 12.4 PRO MATE II: Universal Programmer

The PRO MATE II Universal Programmer is a full-featured programmer capable of operating in stand-alone mode as well as PC-hosted mode. PRO MATE II is CE compliant.

The PRO MATE II has programmable VDD and VPP supplies which allows it to verify programmed memory at VDD min and VDD max for maximum reliability. It has an LCD display for displaying error messages, keys to enter commands and a modular detachable socket assembly to support various package types. In stand-alone mode the PRO MATE II can read, verify or program PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices. It can also set configuration and code-protect bits in this mode.

### 12.5 PICSTART Plus Entry Level Development System

The PICSTART programmer is an easy-to-use, low-cost prototype programmer. It connects to the PC via one of the COM (RS-232) ports. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. PICSTART Plus is not recommended for production programming.

PICSTART Plus supports all PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices with up to 40 pins. Larger pin count devices such as the PIC16C923, PIC16C924 and PIC17C756 may be supported with an adapter socket. PICSTART Plus is CE compliant.

# PIC16CE62X

---

## 12.6 PICDEM-1 Low-Cost PICmicro Demonstration Board

The PICDEM-1 is a simple board which demonstrates the capabilities of several of Microchip's microcontrollers. The microcontrollers supported are: PIC16C5X (PIC16C54 to PIC16C58A), PIC16C61, PIC16C62X, PIC16C71, PIC16C8X, PIC17C42, PIC17C43 and PIC17C44. All necessary hardware and software is included to run basic demo programs. The users can program the sample microcontrollers provided with the PICDEM-1 board, on a PRO MATE II or PICSTART-Plus programmer, and easily test firmware. The user can also connect the PICDEM-1 board to the PICMASTER emulator and download the firmware to the emulator for testing. Additional prototype area is available for the user to build some additional hardware and connect it to the microcontroller socket(s). Some of the features include an RS-232 interface, a potentiometer for simulated analog input, push-button switches and eight LEDs connected to PORTB.

## 12.7 PICDEM-2 Low-Cost PIC16CXX Demonstration Board

The PICDEM-2 is a simple demonstration board that supports the PIC16C62, PIC16C64, PIC16C65, PIC16C73 and PIC16C74 microcontrollers. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-2 board, on a PRO MATE II programmer or PICSTART-Plus, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-2 board to test firmware. Additional prototype area has been provided to the user for adding additional hardware and connecting it to the microcontroller socket(s). Some of the features include a RS-232 interface, push-button switches, a potentiometer for simulated analog input, a Serial EEPROM to demonstrate usage of the I<sup>2</sup>C bus and separate headers for connection to an LCD module and a keypad.

## 12.8 PICDEM-3 Low-Cost PIC16CXXX Demonstration Board

The PICDEM-3 is a simple demonstration board that supports the PIC16C923 and PIC16C924 in the PLCC package. It will also support future 44-pin PLCC microcontrollers with a LCD Module. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-3 board, on a PRO MATE II programmer or PICSTART Plus with an adapter socket, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-3 board to test firmware. Additional prototype area has been provided to the user for adding hardware and connecting it to the microcontroller socket(s). Some of the features include

an RS-232 interface, push-button switches, a potentiometer for simulated analog input, a thermistor and separate headers for connection to an external LCD module and a keypad. Also provided on the PICDEM-3 board is an LCD panel, with 4 commons and 12 segments, that is capable of displaying time, temperature and day of the week. The PICDEM-3 provides an additional RS-232 interface and Windows 3.1 software for showing the demultiplexed LCD signals on a PC. A simple serial interface allows the user to construct a hardware demultiplexer for the LCD signals.

## 12.9 MPLAB™ Integrated Development Environment Software

The MPLAB IDE Software brings an ease of software development previously unseen in the 8-bit microcontroller market. MPLAB is a windows based application which contains:

- A full featured editor
- Three operating modes
  - editor
  - emulator
  - simulator
- A project manager
- Customizable tool bar and key mapping
- A status bar with project information
- Extensive on-line help

MPLAB allows you to:

- Edit your source files (either assembly or 'C')
- One touch assemble (or compile) and download to PICmicro tools (automatically updates all project information)
- Debug using:
  - source files
  - absolute listing file
- Transfer data dynamically via DDE (soon to be replaced by OLE)
- Run up to four emulators on the same PC

The ability to use MPLAB with Microchip's simulator allows a consistent platform and the ability to easily switch from the low cost simulator to the full featured emulator with minimal retraining due to development tools.

## 12.10 Assembler (MPASM)

The MPASM Universal Macro Assembler is a PC-hosted symbolic assembler. It supports all microcontroller series including the PIC12C5XX, PIC14000, PIC16C5X, PIC16CXXX, and PIC17CXX families.

MPASM offers full featured Macro capabilities, conditional assembly, and several source and listing formats. It generates various object code formats to support Microchip's development tools as well as third party programmers.

MPASM allows full symbolic debugging from PICMASTER, Microchip's Universal Emulator System.

MPASM has the following features to assist in developing software for specific use applications.

- Provides translation of Assembler source code to object code for all Microchip microcontrollers.
- Macro assembly capability.
- Produces all the files (Object, Listing, Symbol, and special) required for symbolic debug with Microchip's emulator systems.
- Supports Hex (default), Decimal and Octal source and listing formats.

MPASM provides a rich directive language to support programming of the PICmicro. Directives are helpful in making the development of your assemble source code shorter and more maintainable.

## **12.11 Software Simulator (MPLAB-SIM)**

The MPLAB-SIM Software Simulator allows code development in a PC host environment. It allows the user to simulate the PICmicro series microcontrollers on an instruction level. On any given instruction, the user may examine or modify any of the data areas or provide external stimulus to any of the pins. The input/output radix can be set by the user and the execution can be performed in; single step, execute until break, or in a trace mode.

MPLAB-SIM fully supports symbolic debugging using MPLAB-C and MPASM. The Software Simulator offers the low cost flexibility to develop and debug code outside of the laboratory environment making it an excellent multi-project software development tool.

## **12.12 C Compiler (MPLAB-C17)**

The MPLAB-C Code Development System is a complete 'C' compiler and integrated development environment for Microchip's PIC17CXXX family of microcontrollers. The compiler provides powerful integration capabilities and ease of use not found with other compilers.

For easier source level debugging, the compiler provides symbol information that is compatible with the MPLAB IDE memory display.

## **12.13 Fuzzy Logic Development System (fuzzyTECH-MP)**

*fuzzyTECH-MP* fuzzy logic development tool is available in two versions - a low cost introductory version, MP Explorer, for designers to gain a comprehensive working knowledge of fuzzy logic system design; and a full-featured version, *fuzzyTECH-MP*, Edition for implementing more complex systems.

Both versions include Microchip's *fuzzyLAB*™ demonstration board for hands-on experience with fuzzy logic systems implementation.

## **12.14 MP-DriveWay™ – Application Code Generator**

MP-DriveWay is an easy-to-use Windows-based Application Code Generator. With MP-DriveWay you can visually configure all the peripherals in a PICmicro device and, with a click of the mouse, generate all the initialization and many functional code modules in C language. The output is fully compatible with Microchip's MPLAB-C C compiler. The code produced is highly modular and allows easy integration of your own code. MP-DriveWay is intelligent enough to maintain your code through subsequent code generation.

## **12.15 SEEVAL® Evaluation and Programming System**

The SEEVAL SEEPROM Designer's Kit supports all Microchip 2-wire and 3-wire Serial EEPROMs. The kit includes everything necessary to read, write, erase or program special features of any Microchip SEEPROM product including Smart Serials™ and secure serials. The Total Endurance™ Disk is included to aid in trade-off analysis and reliability calculations. The total kit can significantly reduce time-to-market and result in an optimized system.

## **12.16 KEELOQ® Evaluation and Programming Tools**

KEELOQ evaluation and programming tools support Microchips HCS Secure Data Products. The HCS evaluation kit includes an LCD display to show changing codes, a decoder to decode transmissions, and a programming interface to program test transmitters.

## 13.0 ELECTRICAL SPECIFICATIONS

### Absolute Maximum Ratings †

Ambient Temperature under bias .....	-40° to +125°C
Storage Temperature.....	-65° to +150°C
Voltage on any pin with respect to V <sub>SS</sub> (except V <sub>DD</sub> and $\overline{MCLR}$ ).....	-0.6V to V <sub>DD</sub> +0.6V
Voltage on V <sub>DD</sub> with respect to V <sub>SS</sub> .....	0 to +7.5V
Voltage on $\overline{MCLR}$ with respect to V <sub>SS</sub> (Note 2).....	0 to +14V
Total power Dissipation (Note 1) .....	1.0W
Maximum Current out of V <sub>SS</sub> pin.....	300 mA
Maximum Current into V <sub>DD</sub> pin .....	250 mA
Input Clamp Current, I <sub>IK</sub> (V <sub>I</sub> <0 or V <sub>I</sub> > V <sub>DD</sub> ) .....	±20 mA
Output Clamp Current, I <sub>OK</sub> (V <sub>O</sub> <0 or V <sub>O</sub> >V <sub>DD</sub> ) .....	±20 mA
Maximum Output Current sunk by any I/O pin .....	25 mA
Maximum Output Current sourced by any I/O pin .....	25 mA
Maximum Current sunk by PORTA and PORTB .....	200 mA
Maximum Current sourced by PORTA and PORTB .....	200 mA

**Note 1:** Power dissipation is calculated as follows:  $P_{DIS} = V_{DD} \times \{I_{DD} - \sum I_{OH}\} + \sum \{(V_{DD} - V_{OH}) \times I_{OH}\} + \sum (V_{OL} \times I_{OL})$

† **NOTICE:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

# PIC16CE62X

**TABLE 13-1: CROSS REFERENCE OF DEVICE SPECS FOR OSCILLATOR CONFIGURATIONS AND FREQUENCIES OF OPERATION (COMMERCIAL DEVICES)**

OSC	PIC16CE62X-04	PIC16CE62X-20	PIC16CE62X/JW
RC	VDD: 3.0V to 5.5V IDD: 3.3 mA max. @5.5V IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 4.0 MHz max.	VDD: 3.0V to 5.5V IDD: 1.8 mA typ. @5.5V IPD: 1.0 $\mu$ A typ. @4.0V, WDT DIS Freq: 4.0 MHz max.	VDD: 3.0V to 5.5V IDD: 3.3 mA max. @5.5V IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 4.0 MHz max.
XT	VDD: 3.0V to 5.5V IDD: 3.3 mA max. @5.5V IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 4.0 MHz max.	VDD: 3.0V to 5.5V IDD: 1.8 mA typ. @5.5V IPD: 1.0 $\mu$ A typ. @4.0V, WDT DIS Freq: 4.0 MHz max.	VDD: 3.0V to 5.5V IDD: 3.3 mA max. @5.5V IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 4.0 MHz max.
HS	VDD: 4.5V to 5.5V IDD: 3.0 mA typ. @5.5V IPD: 1.0 $\mu$ A typ. @4.0V, WDT DIS Freq: 4.0 MHz max.	VDD: 4.5V to 5.5V IDD: 7.5 mA max. @5.5V IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 20 MHz max.	VDD: 4.5V to 5.5V IDD: 7.5 mA max. @5.5V IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 20 MHz max.
LP	VDD: 3.0V to 5.5V IDD: 70 $\mu$ A max. @32 kHz, 3.0V, WDT DIS IPD: 2.5 $\mu$ A max. @4.0 V, WDT DIS Freq: 200 kHz max.	Do not use in LP mode	VDD: 3.0V to 5.5V IDD: 70 $\mu$ A max. @32 kHz, 3.0V, WDT DIS IPD: 2.5 $\mu$ A max. @4.0V, WDT DIS Freq: 200 kHz max.

The shaded sections indicate oscillator selections which are tested for functionality, but not for MIN/MAX specifications. It is recommended that the user select the device type that ensures the specifications required.

## 13.1 DC CHARACTERISTICS: PIC16CE62X-04 (Commercial, Industrial, Extended) PIC16CE62X-20 (Commercial, Industrial, Extended)

Standard Operating Conditions (unless otherwise stated)							
Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial and $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ for commercial and $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for extended							
Param No.	Sym	Characteristic	Min	Typ†	Max	Units	Conditions
D001 D001A	VDD	Supply Voltage	3.0 4.5	- -	5.5 5.5	V V	XT, RC and LP osc configuration HS osc configuration
D002	VDR	RAM Data Retention Voltage (Note 1)	-	1.5*	-	V	Device in SLEEP mode
D003	VPOR	VDD start voltage to ensure Power-on Reset	-	VSS	-	V	See section on power-on reset for details
D004	SVDD	VDD rise rate to ensure Power-on Reset	0.05*	-	-	V/ms	See section on power-on reset for details
D005 D005A	VBOR	Brown-out Reset Voltage	3.7 3.7	4.0 4.0	4.3 4.4	V	BODEN configuration bit is cleared (Automotive)
D010  D010A  D013	IDD	Supply Current (Note 2)	-  -	1.8 35 3.0	3.3 70 7.5	mA   mA	XT and RC osc configuration FOSC = 4 MHz, VDD = 5.5V, WDT disabled (Note 4) LP osc configuration, PIC16CE62X-04 only FOSC = 32 kHz, VDD = 4.0V, WDT disabled HS osc configuration FOSC = 20 MHz, VDD = 5.5V, WDT disabled
D021	IPD	Power Down Current (Note 3)	-	1.0	2.5 15	$\mu\text{A}$ $\mu\text{A}$	VDD=4.0V, WDT disabled (125°C)
D022	$\Delta\text{IWDT}$	WDT Current (Note 5)	-	6.0	20 25	$\mu\text{A}$ $\mu\text{A}$	VDD = 4.0V (125°C)
D022A	$\Delta\text{IBOR}$	Brown-out Reset Current (Note 5)	-	75	150	$\mu\text{A}$	BOR enabled, VDD = 5.0V
D023	$\Delta\text{ICOMP}$	Comparator Current for each Comparator (Note 5)	-	60	100	$\mu\text{A}$	VDD = 4.0V
D023A	$\Delta\text{IVREF}$	VREF Current (Note 5)	-	90	200	$\mu\text{A}$	VDD = 4.0V

\* These parameters are characterized but not tested.

† Data in "Typ" column is at 5.0V, 25°C, unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:

OSC1 = external square wave, from rail to rail; all I/O pins tri-stated, pulled to VDD,

MCLR = VDD; WDT enabled/disabled as specified.

3: The power down current in SLEEP mode does not depend on the oscillator type. Power down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD or VSS.

4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula  $I_r = V_{DD}/2R_{ext}$  (mA) with Rext in k $\Omega$ .

5: The  $\Delta$  current is the additional current consumed when this peripheral is enabled. This current should be added to the base IDD or IPD measurement.

# PIC16CE62X

## 13.2 DC CHARACTERISTICS: PIC16CE62X-04 (Commercial, Industrial, Extended) PIC16CE62X-20 (Commercial, Industrial, Extended)

Standard Operating Conditions (unless otherwise stated)							
Operating temperature $-40^{\circ}\text{C} \leq \text{TA} \leq +85^{\circ}\text{C}$ for industrial and $0^{\circ}\text{C} \leq \text{TA} \leq +70^{\circ}\text{C}$ for commercial and $-40^{\circ}\text{C} \leq \text{TA} \leq +125^{\circ}\text{C}$ for extended

**TABLE 13-2: COMPARATOR SPECIFICATIONS**

Operating Conditions: V<sub>DD</sub> range as described in Table 12-1, -40°C<TA<+125°C. Current consumption is specified in Table 13-1.

Param No.	Characteristics	Sym	Min	Typ	Max	Units	Comments
D300	Input offset voltage	V <sub>IOFF</sub>		± 5.0	± 10	mV	
D301	Input common mode voltage	V <sub>ICM</sub>	0		V <sub>DD</sub> - 1.5	V	
D302	CMRR	CMRR	+55*			db	
300	Response Time <sup>(1)</sup>	T <sub>RESP</sub>		150*	400*	ns	PIC16CE62X
301	Comparator Mode Change to Output Valid	T <sub>MC2OV</sub>			10*	µs	

\* These parameters are characterized but not tested.

Note 1: Response time measured with one comparator input at (V<sub>DD</sub> - 1.5)/2 while the other input transitions from V<sub>SS</sub> to V<sub>DD</sub>.

**TABLE 13-3: VOLTAGE REFERENCE SPECIFICATIONS**

Operating Conditions: V<sub>DD</sub> range as described in Table 12-1, -40°C<TA<+125°C. Current consumption is specified in Table 13-1.

Param No.	Characteristics	Sym	Min	Typ	Max	Units	Comments
D310	Resolution	V <sub>RES</sub>	V <sub>DD</sub> /24		V <sub>DD</sub> /32	LSB	
D311	Absolute Accuracy	V <sub>RAA</sub>			±1/4 ±1/2	LSB LSB	Low Range (V <sub>R</sub> R=1) High Range (V <sub>R</sub> R=0)
D312	Unit Resistor Value (R)	V <sub>RUR</sub>		2K*		Ω	Figure 9-2
310	Settling Time <sup>(1)</sup>	T <sub>SET</sub>			10*	µs	

\* These parameters are characterized but not tested.

Note 1: Settling time measured while V<sub>R</sub>R = 1 and V<sub>R</sub><3:0> transitions from 0000 to 1111.

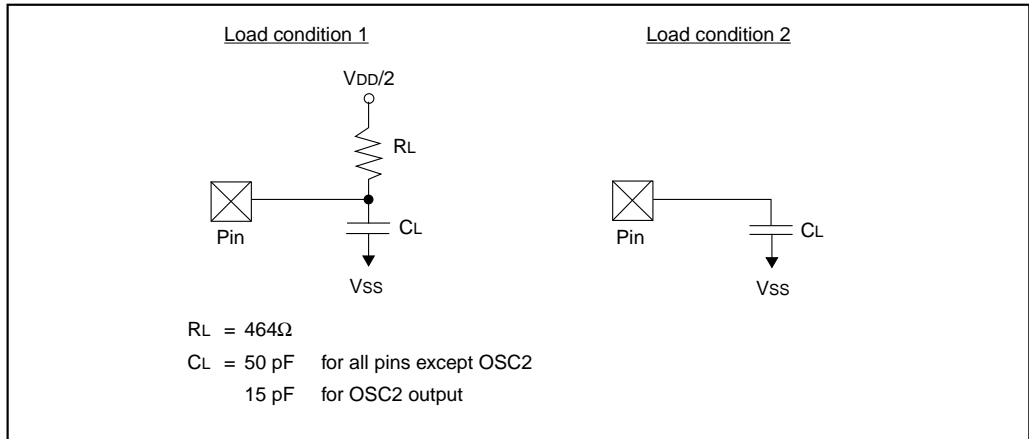

## 13.3 Timing Parameter Symbology

The timing parameter symbols have been created with one of the following formats:

1. TppS2ppS
2. TppS

<b>T</b>		<b>T</b>	
F	Frequency	T	Time
Lowercase subscripts (pp) and their meanings:			
<b>pp</b>		<b>pp</b>	
ck	CLKOUT	osc	OSC1
io	I/O port	t0	T0CKI
mc	MCLR		
Uppercase letters and their meanings:			
<b>S</b>		<b>S</b>	
F	Fall	P	Period
H	High	R	Rise
I	Invalid (Hi-impedance)	V	Valid
L	Low	Z	Hi-Impedance

**FIGURE 13-1: LOAD CONDITIONS**

# PIC16CE62X

## 13.4 Timing Diagrams and Specifications

FIGURE 13-2: EXTERNAL CLOCK TIMING

TABLE 13-4: EXTERNAL CLOCK TIMING REQUIREMENTS

Parameter No.	Sym	Characteristic	Min	Typ†	Max	Units	Conditions
	Fosc	<b>External CLKIN Frequency (Note 1)</b>	DC	—	4	MHz	XT and RC osc mode, VDD=5.0V
			DC	—	20	MHz	HS osc mode
			DC	—	200	kHz	LP osc mode
		<b>Oscillator Frequency (Note 1)</b>	DC	—	4	MHz	RC osc mode, VDD=5.0V
			0.1	—	4	MHz	XT osc mode
1	Tosc	<b>External CLKIN Period (Note 1)</b>	250	—	—	ns	XT and RC osc mode
			50	—	—	ns	HS osc mode
			5	—	—	µs	LP osc mode
		<b>Oscillator Period (Note 1)</b>	250	—	—	ns	RC osc mode
			250	—	10,000	ns	XT osc mode
	2	<b>Instruction Cycle Time (Note 1)</b>	50	—	1,000	ns	HS osc mode
			5	—	—	µs	LP osc mode
			1.0	Fosc/4	DC	µs	TCYS=FOSC/4
3*	TosL, TosH	External Clock in (OSC1) High or Low Time	100*	—	—	ns	XT oscillator, TOSC L/H duty cycle
			2*	—	—	µs	LP oscillator, TOSC L/H duty cycle
			20*	—	—	ns	HS oscillator, TOSC L/H duty cycle
4*	TosR, TosF	External Clock in (OSC1) Rise or Fall Time	25*	—	—	ns	XT oscillator
			50*	—	—	ns	LP oscillator
			15*	—	—	ns	HS oscillator

\* These parameters are characterized but not tested.

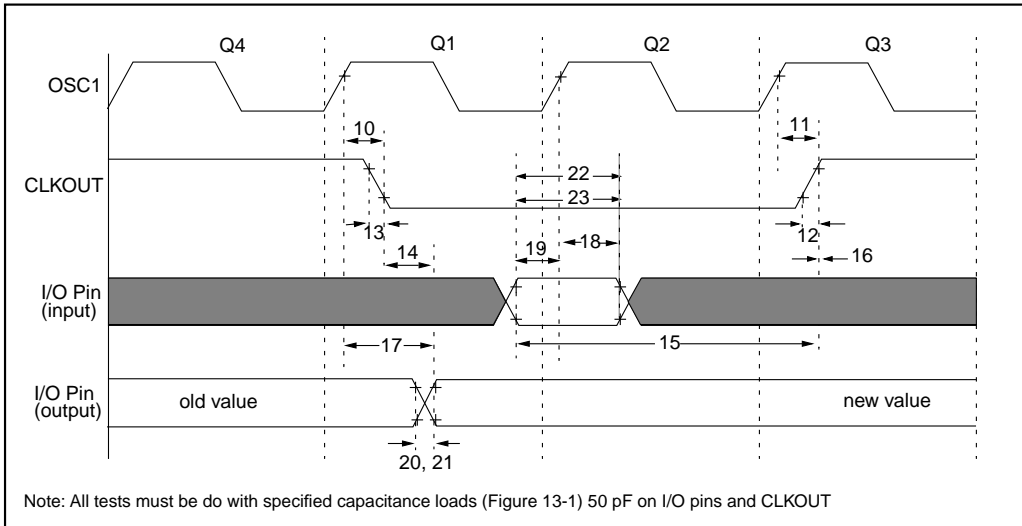

† Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: Instruction cycle period (TCY) equals four times the input oscillator time-base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1 pin.

When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.

**FIGURE 13-3: CLKOUT AND I/O TIMING**

**TABLE 13-5: CLKOUT AND I/O TIMING REQUIREMENTS**

Parameter #	Sym	Characteristic	Min	Typ†	Max	Units
10*	TosH2ckL	OSC1↑ to CLKOUT↓ <sup>(1)</sup>	—	75	200	ns
11*	TosH2ckH	OSC1↑ to CLKOUT↑ <sup>(1)</sup>	—	75	200	ns
12*	TckR	CLKOUT rise time <sup>(1)</sup>	—	35	100	ns
13*	TckF	CLKOUT fall time <sup>(1)</sup>	—	35	100	ns
14*	TckL2ioV	CLKOUT ↓ to Port out valid <sup>(1)</sup>	—	—	20	ns
15*	TioV2ckH	Port in valid before CLKOUT ↑ <sup>(1)</sup>	Tosc +200 ns	—	—	ns
16*	TckH2ioI	Port in hold after CLKOUT ↑ <sup>(1)</sup>	0	—	—	ns
17*	TosH2ioV	OSC1↑ (Q1 cycle) to Port out valid	—	50	150	ns
18*	TosH2ioI	OSC1↑ (Q2 cycle) to Port input invalid (I/O in hold time)	100	—	—	ns
19*	TioV2osH	Port input valid to OSC1↑ (I/O in setup time)	0	—	—	ns
20*	TioR	Port output rise time	—	10	40	ns
21*	TioF	Port output fall time	—	10	40	ns
22*	Tinp	RB0/INT pin high or low time	25	—	—	ns
23	Trbp	RB<7:4> change interrupt high or low time	Tcy	—	—	ns

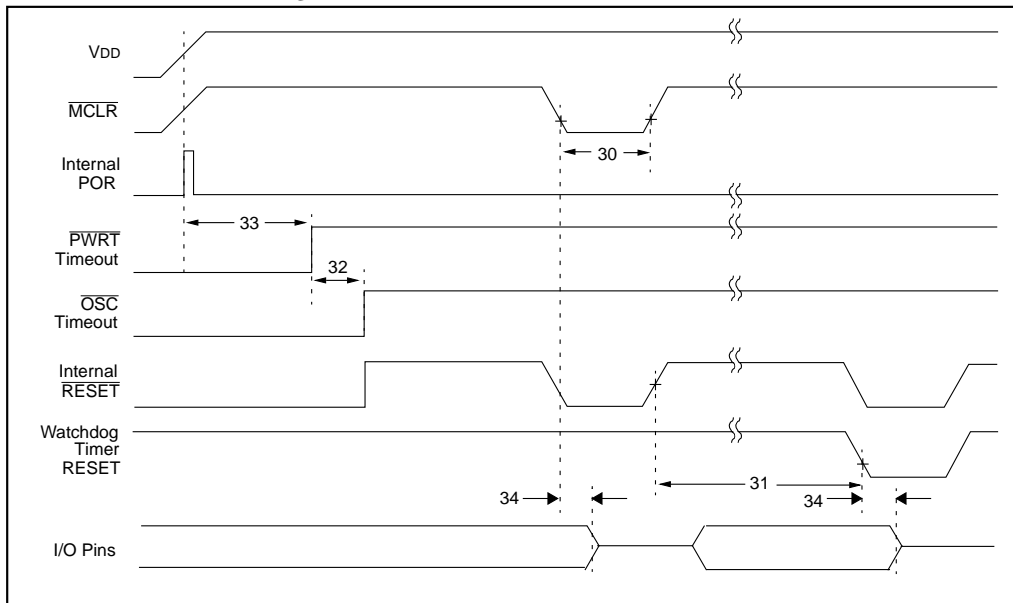

\* These parameters are characterized but not tested

† Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: Measurements are taken in RC Mode where CLKOUT output is 4 x Tosc

SDA and SCL fall time	TF	—	300	—	300	ns	(Note 1)
START condition hold time	THD:STA	4000	—	600	—	ns	After this period the first clock pulse is generated
START condition setup time	TSU:STA	4700	—	600	—	ns	Only relevant for repeated START condition
Data input hold time	THD:DAT	0	—	0	—	ns	(Note 2)
Data input setup time	TSU:DAT	250	—	100	—	ns	
STOP condition setup time	TSU:STO	4000	—	600	—	ns	
Output valid from clock	TAA	—	3500	—	900	ns	(Note 2)
Bus free time	TBUF	4700	—	1300	—	ns	Time the bus must be free before a new transmission can start
Output fall time from VIH minimum to VIL maximum	TOF	—	250	20 +0.1 CB	250	ns	(Note 1), CB ≤ 100 pF
Input filter spike suppression (SDA and SCL pins)	TSP	—	50	—	50	ns	(Note 3)
Write cycle time	TWR	—	10	—	10	ms	Byte or Page mode
Endurance	—	10M 1M	—	10M 1M	—	cycles	25°C, V <sub>CC</sub> = 5.0V, Block Mode (Note 4)

Note 1: Not 100% tested. CB = total capacitance of one bus line in pF.  
 2: As a transmitter, the device must provide an internal minimum delay time to bridge the undefined region (minimum 300 ns) of the falling edge of SCL to avoid unintended generation of START or STOP conditions.  
 3: The combined TSP and VHYS specifications are due to new Schmitt trigger inputs which provide improved noise spike suppression. This eliminates the need for a TI specification for standard operation.  
 4: This parameter is not tested but guaranteed by characterization. For endurance estimates in a specific application, please consult the Total Endurance Model which can be obtained on our website.

## 14.1 Package Marking Information

### 18-Lead PDIP

### Example

### 18-Lead SOIC (.300")

### Example

### 18-Lead CERDIP Windowed

### Example

### 20-Lead SSOP

### Example

<b>Legend:</b> MM...M	Microchip part number information
XX...X	Customer specific information*
AA	Year code (last 2 digits of calendar year)
BB	Week code (week of January 1 is week '01')
C	Facility code of the plant at which wafer is manufactured
	O = Outside Vendor
	C = 5" Line
	S = 6" Line
	H = 8" Line
D	Mask revision number
E	Assembly code of the plant or country of origin in which part was assembled

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.

\* Standard OTP marking consists of Microchip part number, year code, week code, facility code, mask rev#, and assembly code. For OTP marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

**[www.microchip.com](http://www.microchip.com)**

The file transfer site is available by using an FTP service to connect to:

**<ftp://ftp.futureone.com/pub/microchip>**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

## Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-602-786-7302 for the rest of the world.

980106

**Trademarks:** The Microchip name, logo, PIC, PICSTART, PICMASTER and PRO MATE are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries. PICmicro, FlexROM, MPLAB and fuzzy-LAB are trademarks and SQTP is a service mark of Microchip in the U.S.A.

All other trademarks mentioned herein are the property of their respective companies.

## PIC16CE62X PRODUCT IDENTIFICATION SYSTEM

To order or to obtain information, e.g., on pricing or delivery, please use the listed part numbers, and refer to the factory or the listed sales offices.

PART NO.	-XX	X	/XX	XXX	
					<b>Pattern:</b> 3-Digit Pattern Code for QTP (blank otherwise)
					<b>Package:</b> P = PDIP SO = SOIC (Gull Wing, 300 mil body) SS = SSOP (209 mil) JW* = Windowed CERDIP
					<b>Temperature Range:</b> - = 0°C to +70°C I = -40°C to +85°C E = -40°C to +125°C
					<b>Frequency Range:</b> 04 = 200kHz (LP osc) 04 = 4 MHz (XT and RC osc) 20 = 20 MHz (HS osc)
					<b>Device:</b> PIC16CE62X :V <sub>DD</sub> range 3.0V to 5.5V PIC16CE62XT:V <sub>DD</sub> range 3.0V to 5.5V (Tape and Reel)

**Examples:**

a) PIC16CE623-04/P301 = Commercial temp., PDIP package, 4 MHz, normal V<sub>DD</sub> limits, QTP pattern #301.

b) PIC16CE623-04I/SO = Industrial temp., SOIC package, 4MHz, industrial V<sub>DD</sub> limits.

\* JW Devices are UV erasable and can be programmed to any device configuration. JW Devices meet the electrical requirement of each oscillator type.

### Sales and Support

Products supported by a preliminary Data Sheet may possibly have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office.
2. The Microchip Corporate Literature Center U.S. FAX: (602) 786-7277

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

For latest version information and upgrade kits for Microchip Development Tools, please call 1-800-755-2345 or 1-602-786-7302.

1/13/98

*Microchip received ISO 9001 Quality System certification for its worldwide headquarters, design, and wafer fabrication facilities in January, 1997. Our field-programmable PICmicro™ 8-bit MCUs, Serial EEPROMs, related specialty memory products and development systems conform to the stringent quality standards of the International Standard Organization (ISO).*
