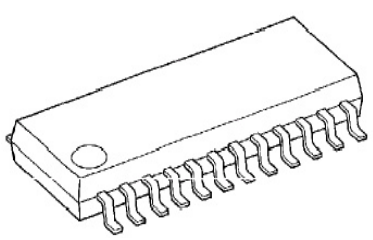
16-bit constant current LED driver with operation supply of 3.3V to 5V

The TB62726AFNA is comprised of constant-current drivers designed for LEDs and LED displays. The output current value can be set using an external resistor. As a result, all outputs will have virtually the same current levels. This driver incorporates a 16-bit constant-current output, a 16-bit shift register, a 16-bit latch and a gate circuit. These drivers have been designed using the Bi-CMOS process.

TB62726AFNA



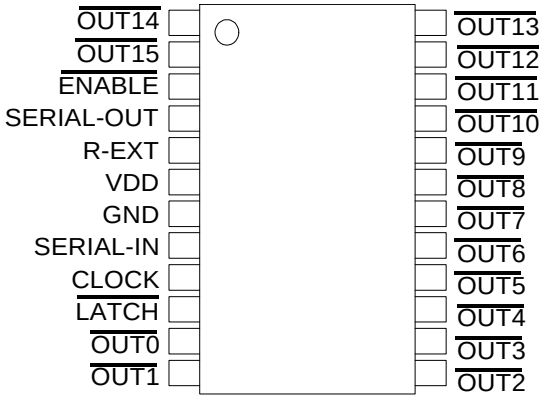
P-SSOP24-150-0.635

Feature

*Output current capability and the number of output:
90 mA x 16 outputs
*Constant current range : 2 to 90 mA
*Application output voltage :
0.7V (output current 2 to 80mA)
0.4V (output current 2 to 40mA)
*For anode common LED
*Input signal voltage level :
3.3V-5.0V CMOS level (schmitt trigger input)
*Power supply voltage range VDD=3.0 to 5.5V
*Muximum output terminal voltage 17V
*Serial and parallel data transfer rate 20 MHz (min., Cascade Connection)
*Operation temperature range topr = -40 to 85 degrees
*Package : P-SSOP24-150-0.635
*Current accuracy (not used dot-current correction.)

Output voltage	Current accuracy		Output current
	between bits	between ICs	
>= 0.4V	+/- 4 %	+/- 12 %	2 to 40 mA
>= 0.7V			2 to 90 mA

Package and pin layout (Top view)



Warnings : Short-circuiting an output terminal to GND or to the power supply terminal may broken the device.
Please take care when wiring the output terminals, the power supply terminal and the GND terminals.

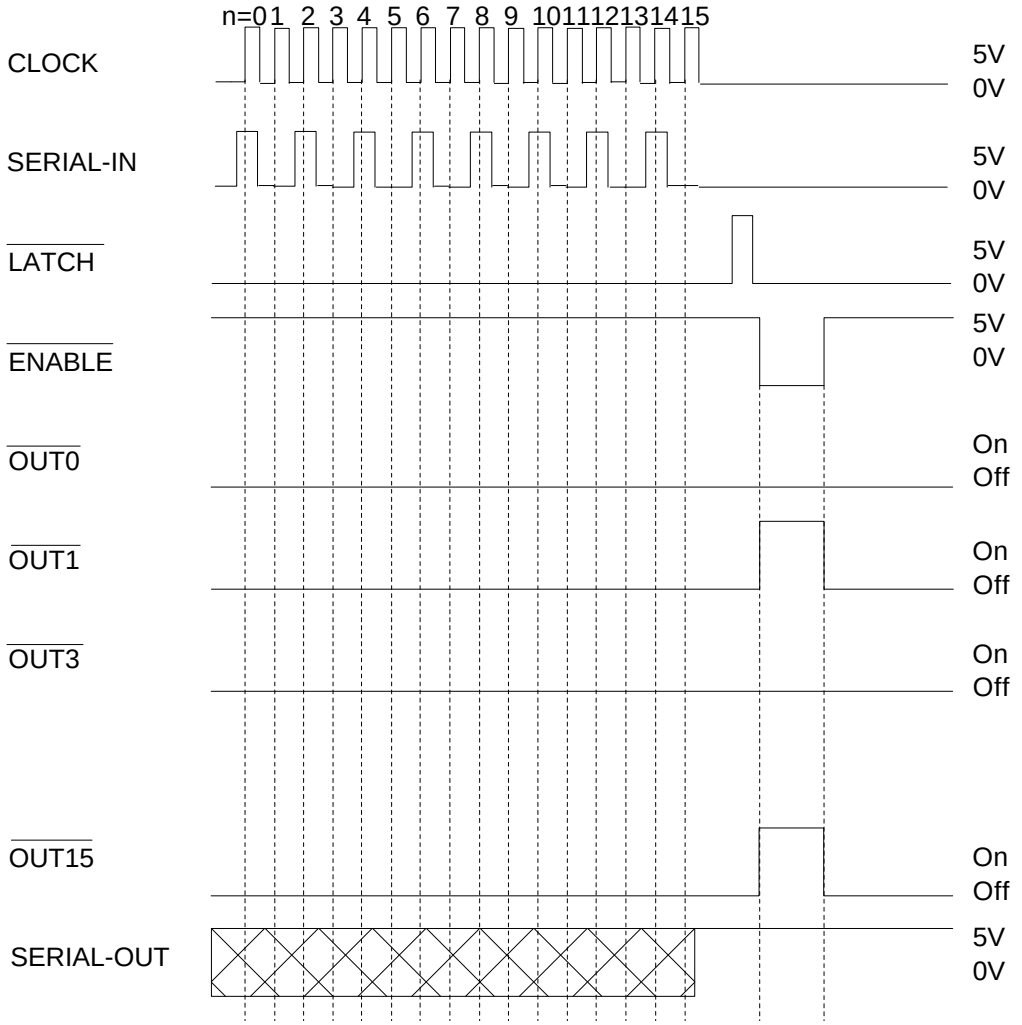
CLOCK	LATCH	ENABLE	SERIAL-IN	OUT0 --- OUT7 --- OUT15	SERIAL-OUT
Positive edge	H	L	Dn	Dn --- Dn-7 --- Dn-15	Dn-15
Positive edge	L	L	Dn+1	No Change	Dn-14
Positive edge	H	L	Dn+2	Dn+2 --- Dn-5 --- Dn-13	Dn-13
Negative edge	X	L	Dn+3	Dn+2 --- Dn-5 --- Dn-13	Dn-13
Negative edge	X	H	Dn+3	Off	Dn-13

Note 1: OUT0~OUT15=ON when Dn=H ; OUT0~OUT15=OFF when Dn=L
In order to ensure that the level of the power supply voltage is correct, an external resistor have to connected between R-EXT and GND.

Timing diagram



Warning :

Latch circuit is leveled-latch circuit. Be careful because it is not triggered-latch circuit.

Note 2 :

The latches circuit holds data by pulling the LATCH terminal Low. And, when LATCH terminal is a High-level, latch circuit doesn't hold data, and it passes from theInput to the output. When ENABLE terminal is Low-level, output terminal OUT0~OUT15 respond to the data, and on & off does.

And, when ENABLE terminal is a High-level, it offs with the output terminal regardless of the data.

Terminal description

Pin No.	Pin Name	Function
7	GND	GND terminal for control logic
8	SERIAL-IN	Input terminal for serial data for data shift register
9	CLOCK	Input terminal for clock for data shift on rising edge
10	$\overline{\text{LATCH}}$	Input terminal for data strobe When the LATCH=High-level, data is no latched. When ithe LATCH=Low-level, data is latched.
1 to 2, 11 to 24	$\overline{\text{OUT 0 to 7}}$	Constant-current output terminals
3	$\overline{\text{ENABLE}}$	Input terminal for output enable. All outputs (OUT0 ~ OUT15) are turned off, when the ENABLE=High-level. And are turned on, when the ENABLE=Low-level.
4	SERIAL-OUT	Output terminal for serial data input on SERIAL-IN terminal
5	R-EXT	Input terminal used to connect an external resistor. This regulated the output current.
6	VDD	3.3V - 5V supply voltage terminal.
