# 1 Overview

This chapter gives an overview of the 200-pin small-outline DDR2 SDRAM modules product family and describes its main characteristics.

## 1.1 Features

- 200-Pin PC2-6400, PC2-5300 and PC2-4200 DDR2 SDRAM memory modules.
- 128Mx64 module organization, and 64Mx16 chip organization
- 1GB Modules built with 1 Gbit DDR2 SDRAMs in PG-TFBGA-84-11 chipsize packages
- Standard Double-Data-Rate-Two Synchronous DRAMs (DDR2 SDRAM) with a single + 1.8 V (± 0.1 V) power supply
- All speed grades faster than DDR2-400 comply with DDR2-400 timing specifications.
- Programmable CAS Latencies (3, 4, 5), Burst Length (8 & 4).
- Auto Refresh (CBR) and Self Refresh
- Auto Refresh for temperatures above 85 °C  $t_{REFI} = 3.9 \mu s$ .
- Programmable self refresh rate via EMRS2 setting.
- Programmable partial array refresh via EMRS2 settings.
- DCC enabling via EMRS2 setting.
- All inputs and outputs SSTL\_1.8 compatible
- Off-Chip Driver Impedance Adjustment (OCD) and On-Die Termination (ODT)
- Serial Presence Detect with E<sup>2</sup>PROM
- SO-DIMM Dimensions (nominal): 50 mm42 mm30 mm high, 67.6 mm wide
- Based on standard reference layouts Raw Cards 'A'
- RoHS compliant products<sup>1)</sup>

**TABLE 1**  
Performance Table

QAG Speed Code			-2.5	-3	-3.7	Unit
DRAM Speed Grade	DDR2		-800E	-667C	-533C	
Module Speed Grade	PC2		-6400E	-5300C	-4200C	
CAS-RCD-RP latencies			6-6-6	4-4-4	4-4-4	$t_{CK}$
Max. Clock Frequency	CL3	$f_{CK3}$	200	200	200	MHz
	CL4	$f_{CK4}$	266	333	266	MHz
	CL5	$f_{CK5}$	333	333	266	MHz
	CL6	$f_{CK6}$	400	-	-	MHz
Min. RAS-CAS-Delay		$t_{RCD}$	15	12	15	ns
Min. Row Precharge Time		$t_{RP}$	15	12	15	ns
Min. Row Active Time		$t_{RAS}$	45	45	45	ns
Min. Row Cycle Time		$t_{RC}$	60	57	60	ns

1) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

## 1.2 Description

The Qimonda HYS64T128020EDL-[2.5/3S/3.7]-B module family are small-outline DIMM modules "SO-DIMMs" with 50 mm42 mm30 mm height based on DDR2 technology. DIMMs are available as non-ECC modules in 128M × 64 (1GB) in organization and density, intended for mounting into 200-pin connector sockets.

The memory array is designed with 1 Gbit Double-Data-Rate-Two (DDR2) Synchronous DRAMs. Decoupling capacitors are mounted on the PCB board. The DIMMs feature serial presence detect based on a serial E<sup>2</sup>PROM device using the 2-pin I<sup>2</sup>C protocol. The first 128 bytes are programmed with configuration data and are write protected; the second 128 bytes are available to the customer.

**TABLE 2**  
Ordering Information for RoHS Compliant Products

Product Type <sup>1)</sup>	Compliance Code <sup>2)</sup>	Description	SDRAM Technology
<b>PC2-6400-666</b>			
HYS64T128020EDL-2.5-B	1GB 2R×16 PC2-6400S-666-12-A0	2 Ranks, Non-ECC	1Gbit (×16)
<b>PC2-5300-555</b>			
HYS64T128020EDL-3S-B	1GB 2R×16 PC2-5300S-555-12-A0	2 Ranks, Non-ECC	1Gbit (×16)
<b>PC2-4200-444</b>			
HYS64T128020EDL-3.7-B	1GB 2R×16 PC2-4200S-444-12-A0	2 Ranks, Non-ECC	1Gbit (×16)

- 1) For detailed information regarding Product Type of Qimonda please see chapter "Product Type Nomenclature" of this datasheet.
- 2) The Compliance Code is printed on the module label and describes the speed grade, for example "PC2-6400S-666-12-A0" where 6400S means Small-Outline DIMM modules with 6.40 GB/sec Module Bandwidth and "666-12" means Column Address Strobe (CAS) latency =6, Row Column Delay (RCD) latency = 6 and Row Precharge (RP) latency = 6 using the latest JEDEC SPD Revision 1.2 and produced on the Raw Card "A".

**TABLE 3**  
Address Format

DIMM Density	Module Organization	Memory Ranks	ECC/ Non-ECC	# of SDRAMs	# of row/bank/column bits	Raw Card
1GB	128M × 64	2	Non-ECC	8	13/3/10	A

- 1) Green Product
- 2) For a detailed description of all functionalities of the DRAM components on these modules see the component data sheet.

## 2 Pin Configurations and Block Diagrams

### 2.1 Pin Configurations

The pin configuration of the Small Outline DDR2 SDRAM DIMM is listed by function in **Table 5** (200 pins). The abbreviations used in columns Pin Type and Buffer Type are explained in **Table 6** and **Table 7** respectively. The Pin numbering is depicted in **Figure 1**

**TABLE 5**  
Pin Configuration of SO-DIMM

Pin No.	Name	Pin Type	Buffer Type	Function
<b>Clock Signals</b>				
30	CK0	I	SSTL	<b>Clock Signals 1:0, Complement Clock Signals 1:0</b> The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and the falling edge of CK. A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock.
164	CK1	I	SSTL	
32	$\overline{\text{CK0}}$	I	SSTL	
166	$\overline{\text{CK1}}$	I	SSTL	
79	CKE0	I	SSTL	<b>Clock Enable Rank 1:0</b> Activates the DDR2 SDRAM CK signal when HIGH and deactivates the CK signal when LOW. By deactivating the clocks, CKE LOW initiates the Power Down Mode or the Self Refresh Mode. <i>Note: 2 Ranks module</i>
80	CKE1	I	SSTL	
	NC	NC	—	<b>Not Connected</b> <i>Note: 1-rank module</i>
<b>Control Signals</b>				
110	$\overline{\text{S0}}$	I	SSTL	<b>Chip Select Rank 1:0</b> Enables the associated DDR2 SDRAM command decoder when LOW and disables the command decoder when HIGH. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by $\overline{\text{S0}}$ ; Rank 1 is selected by $\overline{\text{S1}}$ . Ranks are also called "Physical banks".2 Ranks module
115	$\overline{\text{S1}}$	I	SSTL	
	NC	NC	—	
108	$\overline{\text{RAS}}$	I	SSTL	<b>Row Address Strobe</b> When sampled at the cross point of the rising edge of CK, and falling edge of $\overline{\text{CK}}$ , $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ define the operation to be executed by the SDRAM.
113	$\overline{\text{CAS}}$	I	SSTL	<b>Column Address Strobe</b>

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

Pin No.	Name	Pin Type	Buffer Type	Function
109	$\overline{\text{WE}}$	I	SSTL	<b>Write Enable</b>
<b>Address Signals</b>				
107	BA0	I	SSTL	<b>Bank Address Bus 2:0</b> Selects which DDR2 SDRAM internal bank of four or eight is activated.
106	BA1	I	SSTL	
85	BA2	I	SSTL	<b>Bank Address Bus 2</b> Greater than 512Mb DDR2 SDRAMs
	NC	NC	SSTL	<b>Less than 1Gb DDR2 SDRAMs</b>
102	A0	I	SSTL	<b>Address Bus 12:0</b> During a Bank Activate command cycle, defines the row address when sampled at the cross-point of the rising edge of CK and falling edge of $\overline{\text{CK}}$ . During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of $\overline{\text{CK}}$ . In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is HIGH, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is LOW, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is HIGH, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is LOW, then BA0-BAn are used to define which bank to precharge.

<b>Data Strobe Signals</b>				
13	DQS0	I/O	SSTL	<b>Data Strobe Bus 7:0</b> The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode the data strobe is sourced by the DDR2 SDRAM and is sent at the leading edge of the data window. DQS signals are complements, and timing is relative to the cross-point of respective DQS and $\overline{DQS}$ . If the module is to be operated in single ended strobe mode, all $\overline{DQS}$ signals must be tied on the system board to $V_{SS}$ and DDR2 SDRAM mode registers programmed appropriately.

# 3 Electrical Characteristics

## 3.1 Absolute Maximum Ratings

**Attention:** Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**TABLE 8**  
Absolute Maximum Ratings

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
$V_{DD}$	Voltage on $V_{DD}$ pin relative to $V_{SS}$	-1.0	+2.3	V	1)
$V_{DDQ}$	Voltage on $V_{DDQ}$ pin relative to $V_{SS}$	-0.5	+2.3	V	1)1)
$V_{DDL}$	Voltage on $V_{DDL}$ pin relative to $V_{SS}$	-0.5	+2.3	V	1)1)
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.5	+2.3	V	1)

1) When  $V_{DD}$  and  $V_{DDQ}$  and  $V_{DDL}$  are less than 500 mV;  $V_{REF}$  may be equal to or less than 300 mV.

**TABLE 9**  
Environmental Requirements

Parameter	Symbol	Values		Unit	Note
		Min.	Max.		
Operating temperature (ambient)	$T_{OPR}$	0	+65	°C	
Storage Temperature	$T_{STG}$	- 50	+100	°C	1)
Barometric Pressure (operating & storage)	PBar	+69	+105	kPa	2)
Operating Humidity (relative)	$H_{OPR}$	10	90	%	
Storage Humidity (without condensation)	$H_{STG}$	5	95	%	

1) Storage Temperature is the case surface temperature on the center/top side of the DRAM.

2) Up to 3000 m.

**TABLE 10**

**DRAM Component Operating Temperature Range**

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
$T_{CASE}$	Operating Temperature	0	95	°C	1)2)3)4)

- 1) Operating Temperature is the case surface temperature on the center / top side of the DRAM.
- 2) The operating temperature range are the temperatures where all DRAM specification will be supported. During operation, the DRAM case temperature must be maintained between 0 - 95 °C under all other specification parameters.
- 3) Above 85 °C the Auto-Refresh command interval has to be reduced to  $t_{REFI} = 3.9 \mu s$
- 4) When operating this product in the 85 °C to 95 °C  $T_{CASE}$  temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to "1". When the High Temperature Self Refresh is enabled there is an increase of  $I_{DD6}$  by approximately 50%

### 3.2 DC Operating Conditions

**TABLE 11**

**Supply Voltage Levels and DC Operating Conditions**

Parameter	Symbol	Values			Unit	Note
		Min.	Typ.	Max.		
Device Supply Voltage	$V_{DD}$	1.7	1.8	1.9	V	
Output Supply Voltage	$V_{DDQ}$	1.7	1.8	1.9	V	1)
Input Reference Voltage	$V_{REF}$	$0.49 \times V_{DDQ}$	$0.5 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	2)
SPD Supply Voltage	$V_{DDSPD}$	1.7	—	3.6	V	
DC Input Logic High	$V_{IH(DC)}$	$V_{REF} + 0.125$	—	$V_{DDQ} + 0.3$	V	
DC Input Logic Low	$V_{IL(DC)}$	-0.30	—	$V_{REF} - 0.125$	V	
In / Output Leakage Current	$I_L$	-5	—	5	$\mu A$	3)

- 1) Under all conditions,  $V_{DDQ}$  must be less than or equal to  $V_{DD}$
- 2) Peak to peak AC noise on  $V_{REF}$  may not exceed  $\pm 2\% V_{REF(DC)}$ .  $V_{REF}$  is also expected to track noise in  $V_{DDQ}$ .
- 3) Input voltage for any connector pin under test of  $0 V \leq V_{IN} \leq V_{DDQ} + 0.3 V$ ; all other pins at 0 V. Current is per pin

### 3.3 Timing Characteristics

#### 3.3.1 Speed Grade Definitions

**TABLE 12**  
Speed Grade Definition

Speed Grade		DDR2-800E			Unit	Note
QAG Sort Name		-2.5				
CAS-RCD-RP latencies		6-6-6			$t_{CK}$	
Parameter	Symbol	Min.	Max.	—		
Clock Period	@ CL = 3	$t_{CK}$	5	8	ns	1)2)3)4)
	@ CL = 4	$t_{CK}$	3.75	8	ns	1)2)3)4)

1) Timings are guaranteed with  $\overline{CK}/\overline{CK}$  differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode. Timings are further guaranteed for normal OCD drive strength (EMRS(1) A1 = 0) mentioned in Component datasheet.

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

- 2) The  $\overline{CK}/\overline{CK}$  input reference level (for timing reference to  $\overline{CK}/\overline{CK}$ ) is the point at which CK and  $\overline{CK}$  cross. The  $\overline{DQS}/\overline{DQS}$ ,  $\overline{RDQS}/\overline{RDQS}$ , input reference level is the crosspoint when in differential strobe mode
- 3) Inputs are not recognized as valid until  $V_{REF}$  stabilizes. During the period before  $V_{REF}$  stabilizes,  $CKE = 0.2 \times V_{DDQ}$
- 4) The output timing reference voltage level is  $V_{TT}$ .
- 5)  $t_{RAS,MAX}$  is calculated from the maximum amount of time a DDR2 device can operate without a refresh command which is equal to  $9 \times t_{REFI}$ .

### 3.3.2 Component AC Timing Parameters

**TABLE 14**  
DRAM Component Timing Parameter by Speed Grade - DDR2-800 and DDR2-667

Write command to DQS associated clock edges	WL	RL – 1		RL–1		nCK	

- 1) For details and notes see the relevant Qimonda component data sheet
- 2)  $V_{DDQ} = 1.8 V \pm 0.1V$ ;  $V_{DD} = 1.8 V \pm 0.1 V$ .
- 3) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 4) Timings are guaranteed with CK/ $\overline{CK}$  differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

- 5) The CK /  $\overline{\text{CK}}$  input reference level (for timing reference to CK /  $\overline{\text{CK}}$ ) is the point at which CK and  $\overline{\text{CK}}$  cross. The DQS /  $\overline{\text{DQS}}$ , RDQS /  $\overline{\text{RDQS}}$ , input reference level is the crosspoint when in differential strobe mode. component
- 6) Inputs are not recognized as valid until  $V_{\text{REF}}$  stabilizes. During the period before  $V_{\text{REF}}$  stabilizes,  $\text{CKE} = 0.2 \times V_{\text{DDQ}}$  is recognized as low.
- 7) The output timing reference voltage level is  $V_{\text{TT}}$ . component datasheet
- 8) New units, ' $t_{\text{CK,AVG}}$ ' and 'nCK', are introduced in DDR2-667 and DDR2-800. Unit ' $t_{\text{CK,AVG}}$ ' represents the actual  $t_{\text{CK,AVG}}$  of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2-400 and DDR2-533, ' $t_{\text{CK}}$ ' is used for both concepts. Example:  $t_{\text{XP}} = 2$  [nCK] means; if Power Down exit is registered at  $T_m$ , an Active command may be registered at  $T_m + 2$ , even if  $(T_m + 2 - T_m)$  is  $2 \times t_{\text{CK,AVG}} + t_{\text{ERR,2PER(Min)}}$ .
- 9) When the device is operated with input clock jitter, this parameter needs to be derated by the actual  $t_{\text{ERR(6-10per)}}$  of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2-667 SDRAM has  $t_{\text{ERR(6-10PER),MIN}} = -272$  ps and  $t_{\text{ERR(6-10PER),MAX}} = +293$  ps, then  $t_{\text{DQSK(MIN(DERATED))}} = t_{\text{DQSK(MIN)}} - t_{\text{ERR(6-10PER),MAX}} = -400$  ps - 293 ps = -693 ps and  $t_{\text{DQSK(MAX(DERATED))}} = t_{\text{DQSK(MAX)}} - t_{\text{ERR(6-10PER),MIN}} = 400$  ps + 272 ps = +672 ps. Similarly,  $t_{\text{LZ,DQ}}$  for DDR2-667 derates to  $t_{\text{LZ,DQ(MIN(DERATED))}} = -900$  ps - 293 ps = -1193 ps and  $t_{\text{LZ,DQ(MAX(DERATED))}} = 450$  ps + 272 ps = +722 ps. (Caution on the MIN/MAX usage!)
- 10) Input clock jitter spec parameter. These parameters component datasheet are referred to as 'input clock jitter spec parameters' and these parameters apply to DDR2-667 and DDR2-800 only. The jitter specified is a random jitter meeting a Gaussian distribution.
- 11) These parameters are specified per their average values, however it is understood that the relationship component datasheet between the average timing and the absolute instantaneous timing holds all the times (min. and max of SPEC values are to be used for calculations component datasheet).
- 12)  $t_{\text{CKE,MIN}}$  of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of  $t_{\text{IS}} + 2 \times t_{\text{CK}} + t_{\text{IH}}$ .
- 13)  $\text{DAL} = \text{WR} + \text{RU}\{t_{\text{RP}}(\text{ns}) / t_{\text{CK}}(\text{ns})\}$ , where RU stands for round up. WR refers to the tWR parameter stored in the MRS. For  $t_{\text{RP}}$ , if the result of the division is not already an integer, round up to the next highest integer.  $t_{\text{CK}}$  refers to the application clock period. Example: For DDR2-533 at  $t_{\text{CK}} = 3.75$  ns with  $t_{\text{WR}}$  programmed to 4 clocks.  $t_{\text{DAL}} = 4 + (15 \text{ ns} / 3.75 \text{ ns})$  clocks = 4 + (4) clocks = 8 clocks.
- 14)  $t_{\text{DAL,nCK}} = \text{WR}$  [nCK] +  $t_{\text{nRP,nCK}} = \text{WR} + \text{RU}\{t_{\text{RP}}[\text{ps}] / t_{\text{CK,AVG}}[\text{ps}]\}$ , where WR is the value programmed in the EMR.
- 15) Input waveform timing  $t_{\text{DH}}$  with differential data strobe enabled MR[bit10] = 0, is referenced from the differential data strobe crosspoint to the input signal crossing at the  $V_{\text{IH,DC}}$  level for a falling signal and from the differential data strobe crosspoint to the input signal crossing at the  $V_{\text{IL,DC}}$  level for a rising signal applied to the device under test. DQS, DQS signals must be monotonic between  $V_{\text{IL,DC,MAX}}$  and  $V_{\text{IH,DC,MIN}}$ . See **Figure 3**.
- 16)  $t_{\text{DQSQ}}$ : Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output slew rate mismatch between DQS /  $\overline{\text{DQS}}$  and associated DQ in any given cycle.
- 17) These parameters are measured from a data strobe signal ((L/U/R)DQS /  $\overline{\text{DQS}}$ ) crossing to its respective clock signal (CK /  $\overline{\text{CK}}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e.  $t_{\text{JIT,PER}}$ ,  $t_{\text{JIT,CC}}$ , etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- 18) Input waveform timing  $t_{\text{DS}}$  with differential data strobe enabled MR[bit10] = 0, is referenced from the input signal crossing at the  $V_{\text{IH,AC}}$  level to the differential data strobe crosspoint for a rising signal, and from the input signal crossing at the  $V_{\text{IL,AC}}$  level to the differential data strobe crosspoint for a falling signal applied to the device under test. DQS, DQS signals must be monotonic between  $V_{\text{IH(DC),MAX}}$  and  $V_{\text{IH(DC),MIN}}$ . See **Figure 3**.
- 19) If  $t_{\text{DS}}$  or  $t_{\text{DH}}$  is violated, data corruption may occur and the data must be re-written with valid data before a valid READ can be executed.
- 20) These parameters are measured from a data signal ((L/U)DM, (L/U)DQ0, (L/U)DQ1, etc.) transition edge to its respective data strobe signal ((L/U/R)DQS /  $\overline{\text{DQS}}$ ) crossing.
- 21)  $t_{\text{HP}}$  is the minimum of the absolute half period of the actual input clock.  $t_{\text{HP}}$  is an input parameter but not an input specification parameter. It is used in conjunction with  $t_{\text{QHS}}$  to derive the DRAM output timing  $t_{\text{QH}}$ . The value to be used for  $t_{\text{QH}}$  calculation is determined by the following equation;  $t_{\text{HP}} = \text{MIN}(t_{\text{CH,ABS}}, t_{\text{CL,ABS}})$ , where,  $t_{\text{CH,ABS}}$  is the minimum of the actual instantaneous clock high time;  $t_{\text{CL,ABS}}$  is the minimum of the actual instantaneous clock low time.
- 22)  $t_{\text{HZ}}$  and  $t_{\text{LZ}}$  transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving ( $t_{\text{HZ}}$ ), or begins driving ( $t_{\text{LZ}}$ ).
- 23) input waveform timing is referenced from the input signal crossing at the  $V_{\text{IL,DC}}$  level for a rising signal and  $V_{\text{IH,DC}}$  for a falling signal applied to the device under test. See **Figure 4**.
- 24) Input waveform timing is referenced from the input signal crossing at the  $V_{\text{IH,AC}}$  level for a rising signal and  $V_{\text{IL,AC}}$  for a falling signal applied to the device under test. See **Figure 4**.
- 25) These parameters are measured from a command/address signal (CKE, CS, RAS, CAS, WE, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK /  $\overline{\text{CK}}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e.  $t_{\text{JIT,PER}}$ ,  $t_{\text{JIT,CC}}$ , etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- 26)  $t_{\text{QH}} = t_{\text{HP}} - t_{\text{QHS}}$ , where:  $t_{\text{HP}}$  is the minimum of the absolute half period of the actual input clock; and  $t_{\text{QHS}}$  is the specification value under the max column. (The less half-pulse width distortion present, the larger the  $t_{\text{QH}}$  value is; and the larger the valid data eye will be.) Examples: 1) If the system provides  $t_{\text{HP}}$  of 1315 ps into a DDR2-667 SDRAM, the DRAM provides  $t_{\text{QH}}$  of 975 ps minimum. 2) If the system provides  $t_{\text{HP}}$  of 1420 ps into a DDR2-667 SDRAM, the DRAM provides  $t_{\text{QH}}$  of 1080 ps minimum.

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

- 27)  $t_{QHS}$  accounts for: 1) The pulse duration distortion of on-chip clock circuits, which represents how well the actual  $t_{HP}$  at the input is transferred to the output; and 2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are independent of each other, due to data pin skew, output pattern effects, and pchannel to n-channel variation of the output drivers.
- 28) The Auto-Refresh command interval has been reduced to 3.9  $\mu$ s when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
- 29)  $0\text{ }^{\circ}\text{C} \leq T_{CASE} \leq 85\text{ }^{\circ}\text{C}$ .
- 30)  $85\text{ }^{\circ}\text{C} < T_{CASE} \leq 95\text{ }^{\circ}\text{C}$ .
- 31) A maximum of eight Auto-Refresh commands can be posted to any given DDR2 SDRAM device.
- 32)  $t_{RPST}$  end point and  $t_{RPRE}$  begin point are not referenced to a specific voltage level but specify when the device output is no longer driving ( $t_{RPST}$ ), or begins driving ( $t_{RPRE}$ ). **Figure 2** shows a method to calculate these points when the device is no longer driving ( $t_{RPST}$ ), or begins driving ( $t_{RPRE}$ ) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent.
- 33) When the device is operated with input clock jitter, this parameter needs to be derated by the actual  $t_{JIT.PER}$  of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2-667 SDRAM has  $t_{JIT.PER.MIN} = -72$  ps and  $t_{JIT.PER.MAX} = +93$  ps, then  $t_{RPRE.MIN(DERATED)} = t_{RPRE.MIN} + t_{JIT.PER.MIN} = 0.9 \times t_{CK.AVG} - 72$  ps = + 2178 ps and  $t_{RPRE.MAX(DERATED)} = t_{RPRE.MAX} + t_{JIT.PER.MAX} = 1.1 \times t_{CK.AVG} + 93$  ps = + 2843 ps. (Caution on the MIN/MAX usage!).
- 34) When the device is operated with input clock jitter, this parameter needs to be derated by the actual  $t_{JIT.DUTY}$  of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2-667 SDRAM has  $t_{JIT.DUTY.MIN} = -72$  ps and  $t_{JIT.DUTY.MAX} = +93$  ps, then  $t_{RPST.MIN(DERATED)} = t_{RPST.MIN} + t_{JIT.DUTY.MIN} = 0.4 \times t_{CK.AVG} - 72$  ps = + 928 ps and  $t_{RPST.MAX(DERATED)} = t_{RPST.MAX} + t_{JIT.DUTY.MAX} = 0.6 \times t_{CK.AVG} + 93$  ps = + 1592 ps. (Caution on the MIN/MAX usage!).
- 35) For these parameters, the DDR2 SDRAM device is characterized and verified to support  $t_{nPARAM} = RU\{t_{PARAM} / t_{CK.AVG}\}$ , which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support  $t_{nRP} = RU\{t_{RP} / t_{CK.AVG}\}$ , which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR2-667 5-5-5, of which  $t_{RP} = 15$  ns, the device will support  $t_{nRP} = RU\{t_{RP} / t_{CK.AVG}\} = 5$ , i.e. as long as the input clock jitter specifications are met, Precharge command at  $T_m$  and Active command at  $T_m + 5$  is valid even if  $(T_m + 5 - T_m)$  is less than 15 ns due to input clock jitter.
- 36)  $t_{WTR}$  is at least two clocks ( $2 \times t_{CK}$ ) independent of operation frequency.

- 1) For details and notes see the relevant Qimonda component data sheet
- 2)  $V_{DDQ} = 1.8\text{ V} \pm 0.1\text{ V}$ ;  $V_{DD} = 1.8\text{ V} \pm 0.1\text{ V}$ .
- 3) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 4) Timings are guaranteed with  $\overline{CK}/\overline{CK}$  differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
- 5) The  $\overline{CK}/\overline{CK}$  input reference level (for timing reference to  $\overline{CK}/\overline{CK}$ ) is the point at which  $\overline{CK}$  and  $\overline{CK}$  cross. The  $\overline{DQS}/\overline{DQS}$ ,  $\overline{RDQS}/\overline{RDQS}$ , input reference level is the crosspoint when in differential strobe mode. component
- 6) Inputs are not recognized as valid until  $V_{REF}$  stabilizes. During the period before  $V_{REF}$  stabilizes,  $\overline{CKE} = 0.2 \times V_{DDQ}$  is recognized as low.
- 7) The output timing reference voltage level is  $V_{TT}$ . component datasheet
- 8) For each of the terms, if not already an integer, round to the next highest integer.  $t_{CK}$  refers to the application clock period. WR refers to the WR parameter stored in the MR.
- 9) The clock frequency is allowed to change during self-refresh mode or precharge power-down mode.
- 10) For timing definition, refer to the Component data sheet.
- 11) Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output Slew Rate mis-match between  $\overline{DQS}/\overline{DQS}$  and associated  $\overline{DQ}$  in any given cycle.

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

- 12) MIN ( $t_{CL}$ ,  $t_{CH}$ ) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for  $t_{CL}$  and  $t_{CH}$ ).
- 13) The  $t_{HZ}$ ,  $t_{RPST}$  and  $t_{LZ}$ ,  $t_{RPRE}$  parameters are referenced to a specific voltage level, which specify when the device output is no longer driving ( $t_{HZ}$ ,  $t_{RPST}$ ), or begins driving ( $t_{LZ}$ ,  $t_{RPRE}$ ).  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are verified by design and characterization, but not subject to production test.
- 14) The Auto-Refresh command interval has been reduced to 3.9  $\mu$ s when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
- 15)  $0\text{ }^{\circ}\text{C} \leq T_{CASE} \leq 85\text{ }^{\circ}\text{C}$ .
- 16)  $85\text{ }^{\circ}\text{C} < T_{CASE} \leq 95\text{ }^{\circ}\text{C}$ .
- 17) A maximum of eight Auto-Refresh commands can be posted to any given DDR2 SDRAM device
- 18) The  $t_{RRD}$  timing parameter depends on the page size of the DRAM organization.
- 19) The maximum limit for the  $t_{WPST}$  parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- 20) Minimum  $t_{WTR}$  is two clocks when operating the DDR2-SDRAM at frequencies  $\leq 200$  MHz.
- 21) User can choose two different active power-down modes for additional power saving via MRS address bit A12. In "standard active power-down mode" (MR, A12 = "0") a fast power-down exit timing  $t_{XARD}$  can be used. In "low active power-down mode" (MR, A12 = "1") a slow power-down exit timing  $t_{XARDS}$  has to be satisfied.
- 22) WR must be programmed to fulfill the minimum requirement for the  $t_{WR}$  timing parameter, where  $WR_{MIN}[\text{cycles}] = t_{WR}(\text{ns})/t_{CK}(\text{ns})$  rounded up to the next integer value.  $t_{DAL} = WR + (t_{RP}/t_{CK})$ . For each of the terms, if not already an integer, round to the next highest integer.  $t_{CK}$  refers to the application clock period. WR refers to the WR parameter stored in the MRS.

### 3.3.3 ODT AC Electrical Characteristics

This chapter describes the ODT AC electrical characteristics.

**TABLE 16**  
**ODT AC Characteristics and Operating Conditions for DDR2-667 & DDR2-800**

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
$t_{AOND}$	ODT turn-on delay	2	2	$n_{CK}$	1)
$t_{AON}$	ODT turn-on	$t_{AC,MIN}$	$t_{AC,MAX} + 0.7\text{ ns}$	ns	1)2)
$t_{AONPD}$	ODT turn-on (Power-Down Modes)	$t_{AC,MIN} + 2\text{ ns}$	$2 t_{CK} + t_{AC,MAX} + 1\text{ ns}$	ns	1)
$t_{AOFD}$	ODT turn-off delay	2.5	2.5	$n_{CK}$	1)
$t_{AOF}$	ODT turn-off	$t_{AC,MIN}$	$t_{AC,MAX} + 0.6\text{ ns}$	ns	1)3)
$t_{AOFPD}$	ODT turn-off (Power-Down Modes)	$t_{AC,MIN} + 2\text{ ns}$	$2.5 t_{CK} + t_{AC,MAX} + 1\text{ ns}$	ns	1)
$t_{ANPD}$	ODT to Power Down Mode Entry Latency	3	—	$n_{CK}$	1)
$t_{AXPD}$	ODT Power Down Exit Latency	8	—	$n_{CK}$	1)

- 1) New units, " $t_{CK,AVG}$ " and " $n_{CK}$ ", are introduced in DDR2-667 and DDR2-800. Unit " $t_{CK,AVG}$ " represents the actual  $t_{CK,AVG}$  of the input clock under operation. Unit " $n_{CK}$ " represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2-400 and DDR2-533, " $t_{CK}$ " is used for both concepts. Example:  $t_{XP} = 2 [n_{CK}]$  means; if Power Down exit is registered at  $T_m$ , an Active command may be registered at  $T_m + 2$ , even if  $(T_m + 2 - T_m)$  is  $2 \times t_{CK,AVG} + t_{ERR,2PER(MIN)}$ .
- 2) ODT turn on time min is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from  $t_{AOND}$ , which is interpreted differently per speed bin. For DDR2-667/800,  $t_{AOND}$  is 2 clock cycles after the clock edge that registered a first ODT HIGH counting the actual input clock edges.
- 3) ODT turn off time min is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from  $t_{AOFD}$ , which is interpreted differently per speed bin. For DDR2-667/800, if  $t_{CK(ave)} = 3\text{ ns}$  is assumed,  $t_{AOFD}$  is 1.5 ns (=  $0.5 \times 3\text{ ns}$ ) after the second trailing clock edge counting from the clock edge that registered a first ODT LOW and by counting the actual input clock edges.

**TABLE 17**  
**ODT AC Characteristics and Operating Conditions for DDR2-533**

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
$t_{AOND}$	ODT turn-on delay	2	2	$t_{CK}$	
$t_{AON}$	ODT turn-on	$t_{AC.MIN}$	$t_{AC.MAX} + 1 \text{ ns}$	ns	1)
$t_{AONPD}$	ODT turn-on (Power-Down Modes)	$t_{AC.MIN} + 2 \text{ ns}$	$2 t_{CK} + t_{AC.MAX} + 1 \text{ ns}$	ns	
$t_{AOFD}$	ODT turn-off delay	2.5	2.5	$t_{CK}$	
$t_{AOF}$	ODT turn-off	$t_{AC.MIN}$	$t_{AC.MAX} + 0.6 \text{ ns}$	ns	2)
$t_{AOFPD}$	ODT turn-off (Power-Down Modes)	$t_{AC.MIN} + 2 \text{ ns}$	$2.5 t_{CK} + t_{AC.MAX} + 1 \text{ ns}$	ns	
$t_{ANPD}$	ODT to Power Down Mode Entry Latency	3	—	$t_{CK}$	
$t_{AXPD}$	ODT Power Down Exit Latency	8	—	$t_{CK}$	

- 1) ODT turn on time min. is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from  $t_{AOND}$ , which is interpreted differently per speed bin. For DDR2-400/533,  $t_{AOND}$  is 10 ns (= 2 x 5 ns) after the clock edge that registered a first ODT HIGH if  $t_{CK} = 5 \text{ ns}$ .
- 2) ODT turn off time min. is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from  $t_{AOFD}$ . Both are measured from  $t_{AOFD}$ , which is interpreted differently per speed bin. For DDR2-400/533,  $t_{AOFD}$  is 12.5 ns (= 2.5 x 5 ns) after the clock edge that registered a first ODT HIGH if  $t_{CK} = 5 \text{ ns}$ .

### 3.4 $I_{DD}$ Specifications and Conditions

List of tables defining  $I_{DD}$  Specifications and Conditions.

<b>TABLE 18</b>		
<b><math>I_{DD}</math> Measurement Conditions</b>		
<b>Parameter</b>	<b>Symbol</b>	<b>Note<sup>(1)2)</sup> 3)4)5)</b>
<b>Operating Current 0</b> One bank Active - Precharge; $t_{CK} = t_{CK.MIN}$ , $t_{RC} = t_{RC.MIN}$ , $t_{RAS} = t_{RAS.MIN}$ , CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address and control inputs are SWITCHING, Databus inputs are SWITCHING.	$I_{DD0}$	
<b>Operating Current 1</b> One bank Active - Read - Precharge; $I_{OUT} = 0$ mA, BL = 4, $t_{CK} = t_{CK.MIN}$ , $t_{RC} = t_{RC.MIN}$ , $t_{RAS} = t_{RAS.MIN}$ , $t_{RCD} = t_{RCD.MIN}$ , AL = 0, CL = CL <sub>MIN</sub> ; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address and control inputs are SWITCHING, Databus inputs are SWITCHING.	$I_{DD1}$	6)
<b>Precharge Standby Current</b> All banks idle; $\overline{CS}$ is HIGH; CKE is HIGH; $t_{CK} = t_{CK.MIN}$ ; Other control and address inputs are SWITCHING, Databus inputs are SWITCHING.	$I_{DD2N}$	
<b>Precharge Power-Down Current</b> Other control and address inputs are STABLE, Data bus inputs are FLOATING.	$I_{DD2P}$	
<b>Precharge Quiet Standby Current</b> All banks idle; $\overline{CS}$ is HIGH; CKE is HIGH; $t_{CK} = t_{CK.MIN}$ ; Other control and address inputs are STABLE, Data bus inputs are FLOATING.	$I_{DD2Q}$	
<b>Active Standby Current</b> Burst Read: All banks open; Continuous burst reads; BL = 4; AL = 0, CL = CL <sub>MIN</sub> ; $t_{CK} = t_{CK.MIN}$ ; $t_{RAS} = t_{RAS.MAX}$ , $t_{RP} = t_{RP.MIN}$ ; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address inputs are SWITCHING; Data Bus inputs are SWITCHING; $I_{OUT} = 0$ mA.	$I_{DD3N}$	
<b>Active Power-Down Current</b> All banks open; $t_{CK} = t_{CK.MIN}$ , CKE is LOW; Other control and address inputs are STABLE, Data bus inputs are FLOATING. MRS A12 bit is set to LOW (Fast Power-down Exit);	$I_{DD3P(0)}$	
<b>Active Power-Down Current</b> All banks open; $t_{CK} = t_{CK.MIN}$ , CKE is LOW; Other control and address inputs are STABLE, Data bus inputs are FLOATING. MRS A12 bit is set to HIGH (Slow Power-down Exit);	$I_{DD3P(1)}$	
<b>Operating Current - Burst Read</b> All banks open; Continuous burst reads; BL = 4; AL = 0, CL = CL <sub>MIN</sub> ; $t_{CK} = t_{CK.MIN}$ ; $t_{RAS} = t_{RAS.MAX}$ ; $t_{RP} = t_{RP.MIN}$ ; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands; Address inputs are SWITCHING; Data bus inputs are SWITCHING; $I_{OUT} = 0$ mA.	$I_{DD4R}$	6)
<b>Operating Current - Burst Write</b> All banks open; Continuous burst writes; BL = 4; AL = 0, CL = CL <sub>MIN</sub> ; $t_{CK} = t_{CK.MIN}$ ; $t_{RAS} = t_{RAS.MAX}$ , $t_{RP} = t_{RP.MAX}$ ; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address inputs are SWITCHING; Data Bus inputs are SWITCHING;	$I_{DD4W}$	
<b>Burst Refresh Current</b> $t_{CK} = t_{CK.MIN}$ , Refresh command every $t_{RFC} = t_{RFC.MIN}$ interval, CKE is HIGH, $\overline{CS}$ is HIGH between valid commands, Other control and address inputs are SWITCHING, Data bus inputs are SWITCHING.	$I_{DD5B}$	
<b>Distributed Refresh Current</b> $t_{CK} = t_{CK.MIN}$ , Refresh command every $t_{RFC} = t_{REFI}$ interval, CKE is LOW and $\overline{CS}$ is HIGH between valid commands, Other control and address inputs are SWITCHING, Data bus inputs are SWITCHING.	$I_{DD5D}$	

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

Parameter	Symbol	Note <sup>1)2)3)4)5)</sup>
<b>Self-Refresh Current</b> CKE ≤ 0.2 V; external clock off, CK and $\overline{CK}$ at 0 V; Other control and address inputs are FLOATING, Data bus inputs are FLOATING. $I_{DD6}$ current values are guaranteed up to $T_{CASE}$ of 85 °C max.	$I_{DD6}$	
<b>All Bank Interleave Read Current</b> All banks are being interleaved at minimum $t_{RC}$ without violating $t_{RRD}$ using a burst length of 4. Control and address bus inputs are STABLE during DESELECTS. $I_{out} = 0$ mA.	$I_{DD7}$	6)

- 1)  $V_{DDQ} = 1.8\text{ V} \pm 0.1\text{ V}$ ;  $V_{DD} = 1.8\text{ V} \pm 0.1\text{ V}$
- 2)  $I_{DD}$  specifications are tested after the device is properly initialized and  $I_{DD}$  parameter are specified with ODT disabled.
- 3) Definitions for  $I_{DD}$  see **Table 19**
- 4) For two rank modules: All active current measurements in the same  $I_{DD}$  current mode. The other rank is in  $I_{DD2P}$  Precharge Power-Down Mode.
- 5) For details and notes see the relevant Qimonda component data sheet.
- 6)  $I_{DD1}$ ,  $I_{DD4R}$  and  $I_{DD7}$  current measurements are defined with the outputs disabled ( $I_{OUT} = 0$  mA). To achieve this on module level the output buffers can be disabled using an EMRS(1) (Extended Mode Register Command) by setting A12 bit to HIGH.

**TABLE 19**  
Definitions for  $I_{DD}$

Parameter	Description
LOW	$V_{IN} \leq V_{IL(ac),MAX}$ , HIGH is defined as $V_{IN} \geq V_{IH(ac),MIN}$
STABLE	Inputs are stable at a HIGH or LOW level
FLOATING	Inputs are $V_{REF} = V_{DDQ}/2$
SWITCHING	Inputs are changing between HIGH and LOW every other clock (once per 2 cycles) for address and control signals, and inputs changing between HIGH and LOW every other data transfer (once per cycle) for DQ signals not including mask or strobcs.

$I_{DD6}$	64	64	64	mA	3)6)
$I_{DD7}$	1408	1248	1168	mA	2)

1) Calculated values from component data. ODT disabled.  $I_{DD1}$ ,  $I_{DD4R}$ , and  $I_{DD7}$ , are defined with the outputs disabled.

2) The other rank is in  $I_{DD2P}$  Precharge Power-Down Current mode

3) Both ranks are in the same  $I_{DD}$  current mode

4) Fast: MRS(12)=0

5) Slow: MRS(12)=1

6)  $I_{DD5D}$  and  $I_{DD6}$  values are for  $0^{\circ}\text{C} \leq T_{\text{Case}} \leq 85^{\circ}\text{C}$

## 4 SPD Codes

This chapter lists all hexadecimal byte values stored in the EEPROM of the products described in this data sheet. SPD stands for serial presence detect. All values with XX in the table are module specific bytes which are defined during production.

### List of SPD Code Tables

## Notes

1. Thermal Sensor (Optional)
2. SPD or Combidevice (if used then no Thermal Sensor needed)

# 6 Product Type Nomenclature

Qimonda's nomenclature uses simple coding combined with some proprietary coding. **Table 24** provides examples for module and component product type number as well as the

field number. The detailed field description together with possible values and coding explanation is listed for modules in **Table 25** and for components in **Table 26**.

**TABLE 24**  
Nomenclature Fields and Examples

Example for	Field Number										
	1	2	3	4	5	6	7	8	9	10	11
Micro-DIMM	HYS	64	T	64/128	0	2	0	K	M	-5	-A
DDR2 DRAM	HYB	18	T	512/1G	16		0	A	C	-5	

**TABLE 25**  
DDR2 DIMM Nomenclature

Field	Description	Values	Coding
1	Qimonda Module Prefix	HYS	Constant
2	Module Data Width [bit]	64	Non-ECC
		72	ECC
3	DRAM Technology	T	DDR2
4	Memory Density per I/O [Mbit]; Module Density <sup>1)</sup>	32	256 MByte
		64	512 MByte
		128	1 GByte
		256	2 GByte
		512	4 GByte
5	Raw Card Generation	0 .. 9	Look up table
6	Number of Module Ranks	0, 2, 4	1, 2, 4
7	Product Variations	0 .. 9	Look up table
8	Package, Lead-Free Status	A .. Z	Look up table
9	Module Type	D	SO-DIMM
		M	Micro-DIMM
		R	Registered
		U	Unbuffered
		F	Fully Buffered

HYS64T128020EDL-[2.5/3S/3.7]-B  
Small Outlined DDR2 SDRAM Modules

Field	Description	Values	Coding
10	Speed Grade	-19F	PC2-8500 6-6-6
		-1.9	PC2-8500 7-7-7
		-25F	PC2-6400 5-5-5
		-2.5	PC2-6400 6-6-6
		-3	PC2-5300 4-4-4
		-3S	PC2-5300 5-5-5
		-3.7	PC2-4200 4-4-4
		-5	PC2-3200 3-3-3
11	Die Revision	-A	First
		-B	Second

1) Multiplying “Memory Density per I/O” with “Module Data Width” and dividing by 8 for Non-ECC and 9 for ECC modules gives the overall module memory density in MBytes as listed in column “Coding”.

**TABLE 26**  
DDR2 DRAM Nomenclature

Field	Description	Values	Coding
1	Qimonda Component Prefix	HYB	Constant
2	Interface Voltage [V]	18	SSTL_18
3	DRAM Technology	T	DDR2
4	Component Density [Mbit]	256	256 Mbit
		512	512 Mbit
		1G	1 Gbit
