

**8-Channel High Voltage Analog Switch**

**Ordering Information**

$V_{PP} - V_{NN}$	Package Options	
	28-lead plastic chip carrier	Die
160V	HV2116PJ	HV2116X

**- OBSOLETE -**

**Features**

- HVCMOS® technology for high performance
- Very low quiescent power dissipation – 10µA
- Output On-resistance typically 22 ohms
- Low parasitic capacitances
- DC to 10MHz analog signal frequency
- 50dB typical output off isolation at 5MHz
- CMOS logic circuitry for low power
- Excellent noise immunity
- On-chip shift register, and latch logic circuitry
- Flexible high voltage supplies
- Surface mount package available

**General Description**

**Not recommended for new designs. Please use HV202 instead.**

This device is an 8-channel high-voltage analog switch integrated circuit (IC) intended for use in applications requiring high voltage switching controlled by low voltage control signals, such as ultra-sound imaging and printers. Input data is shifted into an 8-bit shift register which can then be retained in an 8-bit latch. To reduce any possible clock feedthrough noise, Latch Enable ( $\overline{LE}$ ) should be left high until all bits are clocked in. Using HVCMOS technology, this switch combines high voltage bilateral DMOS switches and low power CMOS logic to provide efficient control of high voltage analog signals.

This IC is suitable for various combinations of high voltage supplies, e.g., for HV2116 +40V/-120V, or +80V/-80V or +150V/-10V.

**Absolute Maximum Ratings\***

$V_{DD}$ logic power supply voltage	-0.5V to +18V
$V_{PP} - V_{NN}$ supply voltage	174V
$V_{PP}$ positive high voltage supply	-0.5V to +160V
$V_{NN}$ Negative high voltage supply	+0.5V to -160V
Logic input voltages	-0.5V to $V_{DD} + 0.3V$
Analog signal range	$V_{NN}$ to $V_{PP}$
Peak analog signal current/channel	3.0A
Storage temperature	-65°C to +150°C
Power dissipation	1.2W

\*Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability.

## Operating Conditions

Symbol	Parameter	Value
V <sub>DD</sub>	Logic power supply voltage <sup>1, 3</sup>	10.0 V to 15.5 V
V <sub>PP</sub>	Positive high voltage supply <sup>1, 3</sup>	40V to V <sub>NN</sub> + 160V
V <sub>NN</sub>	Negative high voltage supply <sup>1, 3</sup>	-10.0V to -120V
V <sub>IH</sub>	High-level input voltage	V <sub>DD</sub> -2V to V <sub>DD</sub>
V <sub>IL</sub>	Low-level input voltage	0V to 2.0V
V <sub>SIG</sub>	Analog signal voltage peak to peak <sup>2</sup>	V <sub>NN</sub> +10V to V <sub>PP</sub> -10
T <sub>A</sub>	Operating free air-temperature	0°C to 70°C

**Notes:**

- 1 Power up/down sequence is arbitrary except GND must be powered-up first and powered-down last.
- 2 V<sub>SIG</sub> must be V<sub>NN</sub> ≤ V<sub>SIG</sub> ≤ V<sub>PP</sub> or floating during power up/down transistion.
- 3 Rise and fall times of power supplies V<sub>DD</sub>, V<sub>PP</sub>, and V<sub>NN</sub> should not be less than 1.0msec.

						L		L							OFF	
						H		L							ON	
							L	L								OFF
							H	L								ON
X	X	X	X	X	X	X	X	H	HOLD PREVIOUS STATE							

**Notes:**

1. The eight switches operate independently.
2. Serial data is clocked in on the L→H transition CLK.
3. The switches go to a state retaining their present condition at the rising edge of  $\overline{LE}$ . When  $\overline{LE}$  is low the shift register data flows through the latch.
4.  $D_{OUT}$  is high when switch 7 is on.
5. Shift register clocking has no effect on the switch states if  $\overline{LE}$  is H.
