RECEIVE AGC AMPLIFIER

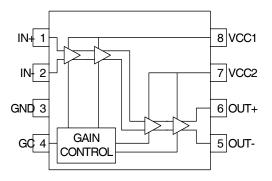

RoHS Compliant & Pb-Free Product Package Style: MSOP-8

Features

- Supports Basestation Applications
- -55dB to +51dB Gain Control Range @ 85MHz
- Single 3V Power Supply
- -2dBm Input IP3
- 12MHz to 385MHz Operation

Applications

- 3V Basestation Systems
- General Purpose Linear IF Amplifier
- Commercial and Consumer Systems
- Portable Battery-Powered Equipment

Functional Block Diagram

Product Description

The RF2637 is a complete AGC amplifier designed for the receive section of 3V cellular and PCS applications basestations. It is designed to amplify IF signals while providing more than 90dB of gain control range. Noise Figure, IP $_3$, and other specifications are designed for basestations. The IC is manufactured on an advanced high frequency SiGe process, and is packaged in a standard miniature 8-lead plastic MSOP package.

Absolute Maximum Ratings

Parameter	Value	Unit
Supply Voltage	-0.5 to +5.0	V _{DC}
Control Voltage	-0.5 to +5.0	V _{DC}
Input RF Power	+10	dBm
Operating Ambient Temperature	-40 to +85	°C
Storage Temperature	-40 to +150	°C

Caution! ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EU Directive 2002/95/EC (at time of this document revision).

Pin	Function	Description	Interface Schematic
1	IN+	CDMA balanced input pin. This pin is internally DC-biased and should be DC-blocked if connected to a device with a DC level other than V_{CC} present. A DC to connection to V_{CC} is acceptable. For single-ended input operation, one pin is used as an input and the other CDMA input is AC-coupled to ground. The balanced input impedance is $1 \mathrm{k}\Omega$, while the single-ended input impedance is 500Ω .	BIAS 700 Ω CDMA-
2	IN-	Same as pin 2, except complementary input.	See pin 1.
3	GND	Ground connection. For best performance, keep traces physically short and connect immediately to ground plane.	
4	GC	Analog gain adjustment for all amplifiers. Valid control ranges are from OV to 2.5 V. Maximum gain is selected with 2.5 V. Minimum gain is selected with OV. These voltages are only valid for a $4.7\mathrm{k}\Omega$ DC source impedance.	23.5 kΩ 212.7 kΩ 215 kΩ
5	OUT-	Balanced output pin. This is an open-collector output, designed to operate into a 250Ω balanced load. The load sets the operating impedance, but an external choke or matching inductor to V_{CC} must also be supplied in order to correctly bias this output. This bias inductor is typically incorporated in the matching network between the output and next stage. Because this pin is biased to V_{CC} , a DC-blocking capacitor must be used if the next stage's input has a DC path to ground.	OUT+ O OUT-
6	OUT+	Same as pin 5, except complementary output.	See pin 5.
7	VCC2	Supply voltage pin. External bypassing is required. The trace length between the pin and the bypass capacitors should be minimized. The ground side of the bypass capacitors should connect immediately to ground plane.	
8	VCC1	Same as pin 7.	See pin 7.

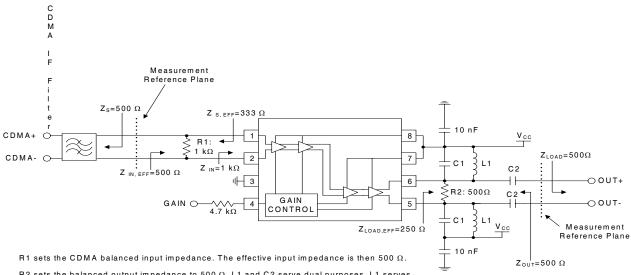

Package Drawing

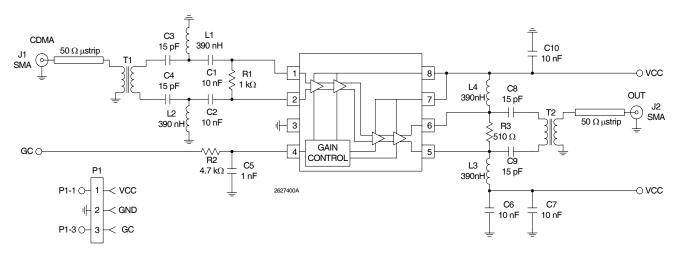

Application Schematic

R2 sets the balanced output impedance to 500 Ω . L1 and C2 serve dual purposes. L1 serves as an output bias choke, and C2 serves as a series DC block. In addition, the values of L1 and C2 may be chosen to form an impedance matching network of the load impedance is not 500 Ω . Otherwise, the values of L1 and C1 are chosen to form a parallel-resonant tank circuit at the IF when the load impedance is 500 Ω .
