

100 MHz Pentium® II Clock Synthesizer/Driver with Spread Spectrum for Mobile or Desktop PCs

Features

- **Mixed 2.5V and 3.3V operation**
- **Clock solution for Pentium® II, and other similar processor-based motherboards**
 - Four 2.5V CPU clocks up to 100 MHz
 - Eight 3.3V sync. PCI clocks, one free-running
 - Two 3.3V 48-MHz USB clocks
 - Three 3.3V Ref. clocks at 14.318 MHz
 - Two 2.5V APIC clocks at 14.318 MHz or PCI/2
- **EMI control**
 - Spread spectrum clocking
 - Factory-EPROM programmable spread spectrum margin
 - Factory-EPROM programmable output drive and slew rate
- **Factory-EPROM programmable CPU clock frequencies for custom configurations**
- **Available in space-saving 48-pin SSOP package**

Functional Description

The CY2280 is a Spread Spectrum clock synthesizer/driver for a Pentium II, or other similar processor-based PC requiring 100-MHz support. All of the required system clocks are provided in a space-saving 48-pin SSOP package. The CY2280 can be used with the CY231x for a total solution for systems with SDRAM.

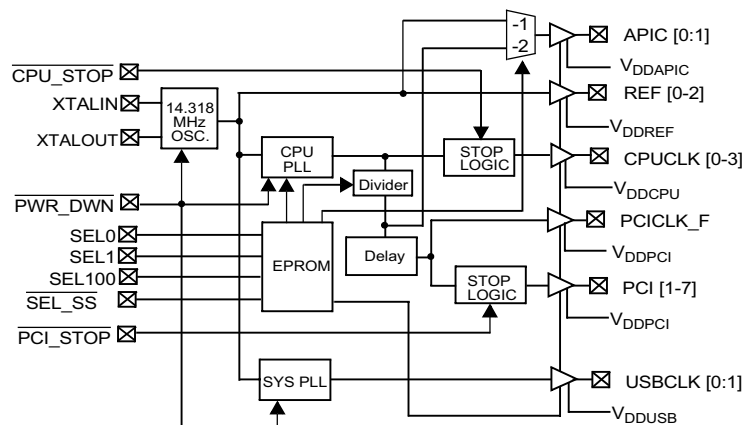

The CY2280 provides the option of spread spectrum clocking on the CPU and PCI clocks for reduced EMI. A downspread percentage is introduced when the SEL_SS input is asserted. The device can be run without spread spectrum when the SEL_SS input is deasserted. The percentage of spreading is EPROM-programmable to optimize EMI-reduction.

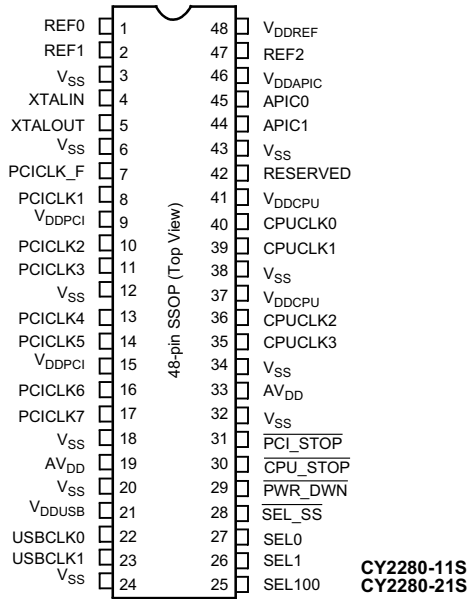

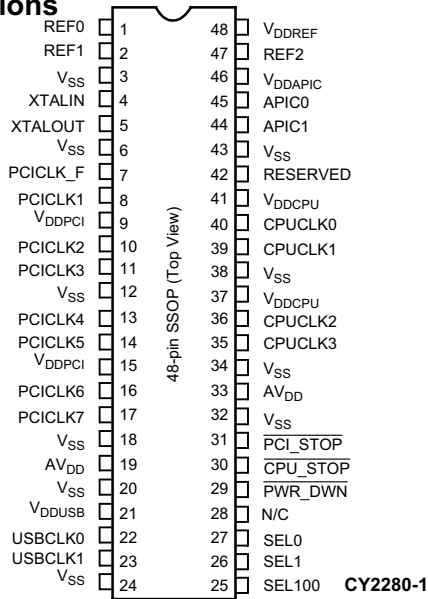

The CY2280 has power-down, CPU stop, and PCI stop pins for power management control. The signals are synchronized on-chip, and ensure glitch-free transitions on the outputs. When the CPU_STOP input is asserted, the CPU clock outputs are driven LOW. When the PCI_STOP input is asserted, the PCI clock outputs (except the free-running PCI clock) are driven LOW. When the PWR_DWN pin is asserted, the reference oscillator and PLLs are shut down, and all outputs are driven LOW.

Pin Summary

Name	Pins	Description
V _{DDPCI}	15, 9	3.3V Digital voltage supply for PCI clocks
V _{DDUSB}	21	3.3V Digital voltage supply for USB clocks
V _{DDREF}	48	3.3V Digital voltage supply for REF clocks
V _{DDAPIC}	46	2.5V Digital voltage supply for APIC clocks
V _{DDCPU}	41, 37	2.5V Digital voltage supply for CPU clocks
AV _{DD}	33, 19	Analog voltage supply, 3.3V
V _{SS}	3, 6, 12, 18, 20, 24, 32, 34, 38, 43	Ground
XTALIN ^[1]	4	Reference crystal input
XTALOUT ^[1]	5	Reference crystal feedback
PCI_STOP	31	Active LOW control input to stop PCI clocks
CPU_STOP	30	Active LOW control input to stop CPU clocks
PWR_DWN	29	Active LOW control input to power down device
SEL_SS	28	Spread spectrum select input (-11S and -21S options)
N/C	28	Spread spectrum select input (-1 option)
SEL0	27	CPU frequency select input, bit 0 (see Function Table)
SEL1	26	CPU frequency select input, bit 1 (see Function Table)
SEL100	25	CPU frequency select input, selects between 100 MHz and 66.6 MHz (see Function Table)
CPUCLK[0:3]	40, 39, 36, 35	CPU clock outputs
PCICLK[1:7]	8, 10, 11, 13, 14, 16, 17	PCI clock outputs, at one-half or one-third the CPU frequency of 66.6 MHz or 100 MHz respectively
PCICLK_F	7	Free-running PCI clock output
APIC[0:1]	45, 44	APIC clock outputs
REF[0:2]	1, 2, 47	3.3V Reference clock outputs
USBCLK[0:1]	22, 23	USB clock outputs
RESERVED	42	Reserved

Note:

1. For best accuracy, use a parallel-resonant crystal, C_{LOAD} = 18 pF.

Application Information

Clock traces must be terminated with either series or parallel termination, as is normally done.

Application Circuit

Cd = DECOUPLING CAPACITORS

Ct = OPTIONAL EMI-REDUCING CAPACITORS

Cx = OPTIONAL LOAD MATCHING CAPACITOR

Rs = SERIES TERMINATING RESISTORS

Summary

- A parallel-resonant crystal should be used as the reference to the clock generator. The operating frequency and C_{LOAD} of this crystal should be as specified in the data sheet. Optional trimming capacitors may be needed if a crystal with a different C_{LOAD} is used. Footprints must be laid out for flexibility.
- Surface mount, low-ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of 0.1 μ F. In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where R_{trace} is the loaded characteristic impedance of the trace, R_{out} is the output impedance of the clock generator (specified in the data sheet), and R_{series} is the series terminating resistor.

$$R_{series} > R_{trace} - R_{out}$$
- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7 pF to 22 pF.
- A Ferrite Bead **may** be used to isolate the Board V_{DD} from the clock generator V_{DD} island. Ensure that the Ferrite Bead offers greater than 50 Ω impedance at the clock frequency, under loaded DC conditions. Please refer to the application note "Layout and Termination Techniques for Cypress Clock Generators" for more details.
- If a Ferrite Bead is used, a 10 μ F–22 μ F tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.

Test Circuit

Notes:

Each supply pin must have an individual decoupling capacitor.
All capacitors must be placed as close to the pins as is possible.
