

General Description

The AAT3169 is a low noise, constant frequency charge pump DC/DC converter that uses a tri-mode load switch (1X), fractional (1.5X), and doubling (2X) conversion to maximize efficiency for white LED applications. The AAT3169 is capable of driving six LEDs for a total of 180mA from a 2.7V to 5.5V input. The current sinks may be operated individually or in parallel for driving higher current LEDs. A low external parts count (two 1 μ F flying capacitors and two small 1 μ F capacitors at IN and OUTCP) make this part ideally suited for small, battery-powered applications.

AnalogicTech's AS²Cwire™ (Advanced Simple Serial Control™) serial digital input is used to enable, disable, and set current for each LED with a 16-level logarithmic scale plus four low-current settings down to 115 μ A. For optimized efficiency, low-current settings require only 65 μ A of housekeeping current.

Each output of the AAT3169 is equipped with built-in protection for output short-circuit and auto-disable for load short-circuit conditions. Built-in soft-start circuitry prevents excessive inrush current during start-up. A low-current shutdown feature disconnects the load from the input and reduces quiescent current to less than 1 μ A.

The AAT3169 is available in a Pb-free, space-saving, thermally-enhanced 16-pin 4x4mm QFN package or a low-profile 14-pin 3x3mm STDFN package and is rated over the -40°C to +85°C temperature range.

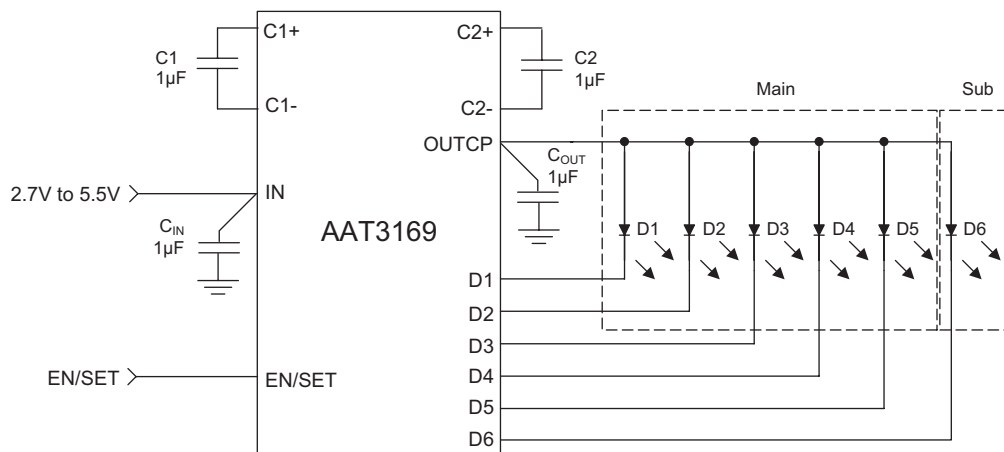

Features

- V_{IN} Range: 2.7V to 5.5V
- Fully Programmable Current with Single Wire
 - 16-Step Logarithmic Scale
 - 15/20/30mA Max Current
 - Four Low-Current Settings Down to 115 μ A
 - Low I_Q (65 μ A) for Single-Channel, Low-Current Mode
- Tri-Mode 1X, 1.5X, and 2X Charge Pump for Maximum Efficiency and V_F Coverage
- Drives Up to Six LEDs
- Individual Main-Sub (5-1) Group Control
- No Inductors, Low Noise Operation
- 1MHz Constant Switching Frequency
- Small Application Circuit
- Built-In Thermal Protection
- Built-In Auto-Disable for Open Circuit
- Automatic Soft Start
- $I_Q < 1\mu$ A in Shutdown
- Thermally-Enhanced STDFN33-14 or QFN44-16 Package

Applications

- Color (RGB) Lighting
- Programmable Current Sink
- Transmissive Displays
- White LED Backlighting
- White Photo Flash for Digital Still Cameras

Typical Application

Pin Descriptions

Pin #		Symbol	Function
AAT3169ISN	AAT3169IFP		
1	2	D6	Current sink input #6.
2	3	EN/SET	AS ² Cwire serial interface control pin.
3	n/a	N/C	No connection.
4	6	OUTCP	Charge pump output to drive load circuit. Requires 1μF capacitor connected between this pin and ground.
5	7	C2+	Flying capacitor 2 positive terminal. Connect a 1μF capacitor between C2+ and C2-.
6	4	C1+	Flying capacitor 1 positive terminal. Connect a 1μF capacitor between C1+ and C1-.
7	5	C1-	Flying capacitor 1 negative terminal.
8	8	C2-	Flying capacitor 2 negative terminal.
9, 11	10	GND	Ground.
10	9	IN	Input power supply. Requires 1μF capacitor connected between this pin and ground.
12	11	D1	Current sink input #1.
13	12	D2	Current sink input #2.
14	13	D3	Current sink input #3.
15	14	D4	Current sink input #4.
16	1	D5	Current sink input #5.
EP	n/a		Exposed paddle (bottom); connect to ground as closely as possible to the package.

Absolute Maximum Ratings¹

Symbol	Description	Value	Units
V_{IN}	Input Voltage to GND	-0.3 to 6	V
$V_{EN/SET}$	EN/SET Voltage to GND	-0.3 to $V_{IN} + 0.3$	V
I_{OUT}^2	Maximum DC Output Current	210	mA
T_J	Operating Junction Temperature Range	-40 to 150	°C
T_{LEAD}	Maximum Soldering Temperature (at leads, 10 sec)	300	°C

Thermal Information³

Symbol	Description	Value	Units
P_D	Maximum Power Dissipation	QFN44-16 ⁴	2.0
		STDFN33-14 ⁴	W
θ_{JA}	Maximum Thermal Resistance	QFN44-16	50
		STDFN33-14	-40 to 150

1. Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum Rating should be applied at any one time.

2. Based on long-term current density limitation.

3. Mounted on an FR4 board.

4. Derate 20mW/°C above 25°C.

Electrical Characteristics¹

$C_{IN} = C_{OUT} = C_1 = C_2 = 1.0\mu\text{F}$; $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = 25^\circ\text{C}$, $V_{IN} = 3.6\text{V}$.

Symbol	Description	Conditions	Min	Typ	Max	Units
Input Power Supply						
V_{IN}	Operation Range		2.7		5.5	V
I_{CC}	Operating Current	1X Mode, $3.0 \leq V_{IN} \leq 5.5$, Active, No Load Current, High Current Mode		0.3		mA
		1.5X Mode, $3.0 \leq V_{IN} \leq 5.5$, Active, No Load Current, High Current Mode		1		
		2X Mode, $3.0 \leq V_{IN} \leq 5.5$, Active, No Load Current, High Current Mode		1		
		1X Mode, $3.0 \leq V_{IN} \leq 5.5$, D6 Active, No Load Current, Low Current Mode		65	90	μA
I_{SHDN}	Shutdown Current	$V_{EN/SET} = 0\text{V}$			1	μA
I_{DX}	Current Accuracy	$I_{SET} = 20\text{mA}$, $T_A = 25^\circ\text{C}$	-10		10	%
		$I_{SET} = 2.4\text{mA}$, $T_A = 25^\circ\text{C}$	-20		20	
	Low Current Accuracy	$I_{SET} = 400\mu\text{A}$, $T_A = 25^\circ\text{C}$	-20		20	
$I_{(D-Match)}$	Current Matching ²	$V_F:D1:D6 = 3.6\text{V}$		0.5	1	%
V_{TH}	1X to 1.5X or 1.5X to 2X Transition Threshold at Any I_{SINK} Pin	$I_{SET} = 20\text{mA}$		150		mV

Functional Block Diagram

Functional Description

The AAT3169 is a tri-mode load switch (1X) and high efficiency (1.5X or 2X) charge pump device intended for white LED backlight applications. To maximize power conversion efficiency, an internal sensing circuit monitors the voltage required on each constant current sink input and sets the load switch and charge pump modes based on the input battery voltage and the current sink input voltage. As the battery discharges over time, the AAT3169 charge pump is enabled when any of the six current sink inputs near dropout. The charge pump initially starts in 1.5X mode. If the charge pump output droops enough for any current source output to become close to dropout, the charge pump will automatically transition to 2X mode. The AAT3169 requires only four external components: two $1\mu\text{F}$ ceramic capacitors for the charge pump flying capacitors (C1 and C2), one $1\mu\text{F}$ ceramic input capacitor (C_{IN}), and one $0.33\mu\text{F}$ to $1\mu\text{F}$ ceramic charge pump output capacitor (C_{OUT}).

The six constant current sink inputs (D1 to D6) can drive six individual LEDs with a maximum current of 30mA nominal each. Unused sink inputs should be connected to OUTCP, otherwise the part will operate only in 2X charge pump mode. The AS²Cwire serial interface enables the AAT3169 and sets the current sink magni-

tudes. AS²Cwire addressing allows independent control of two groups of current sink input: D1~D5 and D6.

Constant Current Output Level Settings

The constant current sink levels for D1 to D6 are set via the serial interface according to a logarithmic scale where each code is approximately 1.8dB lower than the previous code. In this manner, LED brightness appears linear with each increasing code count. Because the inputs D1 to D6 are true independent constant current sinks, the voltage observed on any single given input will be determined by the actual forward voltage (V_F) for the LED being driven.

Since the input current sinks of the AAT3169 are programmable, no PWM (pulse width modulation) or additional control circuitry is needed to control LED brightness. This feature greatly reduces the burden on a microcontroller or system IC to manage LED or display brightness, allowing the user to “set it and forget it.” With its high-speed serial interface (1MHz data rate), the input sink current of the AAT3169 can be changed successively to brighten or dim LEDs in smooth transitions (e.g., to fade-out) or in abrupt steps, giving the user complete programmability and real-time control of LED brightness.

SwitchReg™

High Efficiency 1X/1.5X/2X Charge Pump for White LED Applications

The 16 individual current level settings are each approximately 1.8dB apart (see Table 1). Code 1 is full scale; Code 15 is full scale attenuated by approximately 25dB; and Code 16 is reserved as a “no current” setting.

Data	Mean 30mA Max	Mean 20mA Max	Mean 15mA Max
1	30.0	20.0	15.0
2	29.3	19.5	14.6
3	27.8	18.5	13.9
4	25.2	17.5	12.7
5	22.8	15.4	11.5
6	20.9	14.2	10.5
7	18.5	12.5	9.3
8	16.1	10.9	8.1
9	13.7	9.3	7.0
10	10.0	8.0	6.0
11	9.4	6.5	4.9
12	7.0	4.9	3.7
13	4.7	3.3	2.6
14	3.3	2.4	1.9
15	1.9	1.5	1.2
16	0.0	0.0	0.0

Table 1: Mean Table of AAT3169 Output Current.

AS²Cwire Serial Interface

The current sink input magnitude on the AAT3169 is controlled by AnalogicTech’s Advanced Simple Serial Control (AS²Cwire) serial digital input. AS²Cwire adds addressing capability for multiple data registers over the Simple Serial Control™ (S²Cwire™), which is only capable of controlling a single register. The AAT3169 has four registers: Bank1, Bank2, Max Current, and Low Current.

Three addresses are used to control the two registers. Address 0 addresses both registers simultaneously to allow the loading of both registers with the same data using a single write protocol. Address 1 addresses Register 1 for D1 to D5 current level settings. Address 2 addresses Register 2 for D6 current level settings.

AS²Cwire relies on the number of rising edges of the EN/SET pin to address and load the registers. AS²Cwire latches data or address after the EN/SET pin has been held high for time T_{LAT}. Address or data is differentiated by the number of EN/SET rising edges. Since the data registers are 4 bits each, the differentiating number of pulses is 2⁴ or 16, so that Address 0 is signified by 17 rising edges, Address 1 by 18 rising edges, and Address 2 by 19 rising edges. Data is set to any number of rising

edges between 1 and including 16. A typical write protocol is a burst of EN/SET rising edges, signifying a particular address, followed by a pause with EN/SET held high for the T_{LAT} timeout period, a burst of rising edges signifying data, and a T_{LAT} timeout for the data registers. Once an address is set, then multiple writes consisting of data only (without address) to the corresponding data register are allowed. Address 0 is the default address on the first rising edge after the AAT3169 has been disabled. If data is presented on the first rising edge with no prior address, both data registers are simultaneously loaded.

The maximum current level is determined by the value set in Register 3, the Max Current register. Three scales are available for high operating currents with maximum current levels of 30mA, 20mA, or 15mA. Each scale maintains approximately 1.8dB steps between settings. A separate mode is available for ultra-low LED current operation. When the Max Current register (Register 3) is set to the Low Current setting, the Low Current register (Register 4) must be programmed. The two most significant bits of the Low Current register control whether or not a given bank of current sinks is enabled. The least two significant bits of the Low Current register sets the current level for both banks. For low current settings, the charge pump may be enabled if required by the battery voltage and LED forward voltage conditions, and 1X mode quiescent current is approximately 130µA for multiple channels or 65µA for Channel 6 operation only. Both banks of current sinks must be in the same high or low current mode of operation.

When EN/SET is held low for an amount of time greater than T_{OFF}, the AAT3169 enters shutdown mode and draws less than 1µA from the input. Data and Address registers are reset to 0 during shutdown.

AS²Cwire Serial Interface Addressing

Address	EN/SET Rising Edges	Data Register AAT3169
0	17	1&2: D1~D6 Current
1	18	1: D1~D5 Current
2	19	2: D6 Current
3	20	3: Max Current
4	21	4: Low Current
Data	Max Current	
1	20mA	
2	30mA	
3	15mA	
4	Low Current (see Low Current Register for values)	

Low Current Register (Address 4)

Data	Main Low Current On	Sub Low Current On	Current
1	No	No	
2	No	No	
3	No	No	
4	No	No	
5	No	Yes	115µA
6	No	Yes	175µA
7	No	Yes	280µA
8	No	Yes	400µA
9	Yes	No	115µA
10	Yes	No	175µA
11	Yes	No	280µA
12	Yes	No	400µA
13	Yes	Yes	115µA
14	Yes	Yes	175µA
15	Yes	Yes	280µA
16	Yes	Yes	400µA

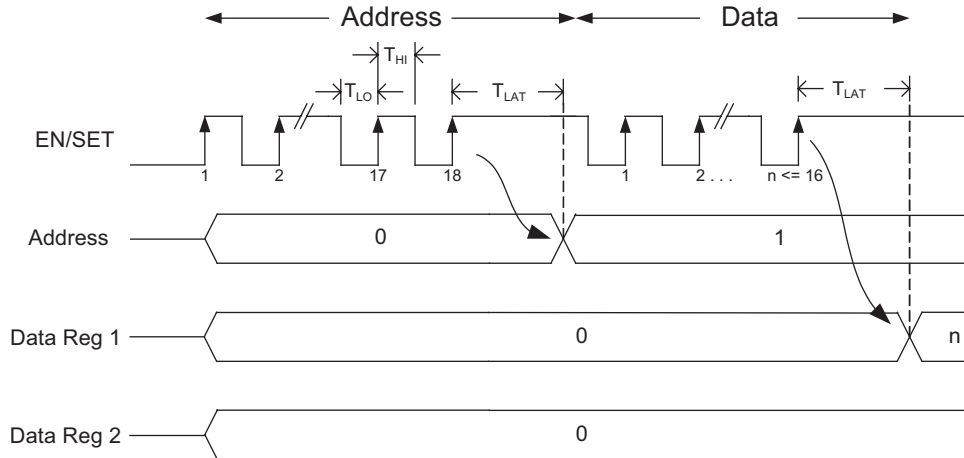

Auto-Disable Feature

AAT3169 is equipped with an auto-disable feature for each LED channel. After the IC is enabled and started up, a test current of 120µA (typical) is forced through each sink channel. The channel will be disabled if the voltage of that particular SINK pin does not drop to a certain threshold. This feature is very convenient for disabling an unused channel or during an LED fail-short event.

Thermal Protection

The AAT3169 has a built-in thermal protection circuit that will shut down the charge pump if the die temperature rises above the thermal limit, as would be the case during a short circuit of the OUTCP pin.

AS²Cwire Serial Interface Timing

Applications Information

LED Selection

Although the AAT3169 is designed for driving white LEDs, the device also can be used to drive most types of LEDs with forward voltages from 2.0V to 4.7V. LED applications may include main and sub-LCD display backlighting, camera photo-flash applications, color (RGB) LEDs, infrared (IR) diodes for remotes, and other loads benefiting from a controlled output current generated from a varying input voltage. Since the D1 to D6 input current sinks are matched with negligible voltage dependence, the LED brightness will be matched regardless of the specific LED forward voltage (V_F) levels.

In some instances (e.g., in high luminous output applications such as photo flash), it may be necessary to drive high- V_F type LEDs. The low dropout current sinks in the AAT3169 make it capable of driving LEDs with forward voltages as high as 4.7V at full current from an input supply as low as 3.0V. Outputs can be paralleled to drive high-current LEDs without complication.

Device Switching Noise Performance

The AAT3169 operates at a fixed frequency of approximately 1MHz to control noise and limit harmonics that can interfere with the RF operation of cellular telephone handsets or other communication devices. Back-injected noise appearing on the input pin of the charge pump is 20mV peak-to-peak, typically ten times less than inductor-based DC/DC boost converter white LED backlight solutions. The AAT3169 soft-start feature prevents noise transient effects associated with inrush currents during start-up of the charge pump circuit.

Capacitor Selection

Careful selection of the four external capacitors (C_{IN} , C_1 , C_2 , and C_{OUT}) is important because they will affect turn-on time, output ripple, and transient performance. Optimum performance will be obtained when low ESR ceramic capacitors are used; in general, low ESR may be defined as less than 100m Ω . A value of 1 μ F for all four capacitors is a good starting point when choosing capacitors. If the LED current sources are programmed only for light current levels, then the capacitor size may be decreased.

Capacitor Characteristics

Ceramic composition capacitors are highly recommended over all other types of capacitors for use with the AAT3169. Ceramic capacitors offer many advantages over their tantalum and aluminum electrolytic counterparts. A ceramic capacitor typically has very low equivalent series resistance (ESR), is lowest cost, has a smaller PCB footprint, and is non-polarized. Low ESR ceramic capacitors help maximize charge pump transient response. Since ceramic capacitors are non-polarized, they are not prone to incorrect connection damage.

Equivalent Series Resistance

ESR is an important characteristic to consider when selecting a capacitor. ESR is resistance internal to a capacitor that is caused by the leads, internal connections, size or area, material composition, and ambient temperature. Capacitor ESR is typically measured in milliohms for ceramic capacitors and can range to more than several ohms for tantalum or aluminum electrolytic capacitors.

Ceramic Capacitor Materials

Ceramic capacitors less than 0.1 μ F are typically made from NPO or COG materials. NPO and COG materials generally have tight tolerance and are very stable over temperature. Larger capacitor values are usually composed of X7R, X5R, Z5U, or Y5V dielectric materials. Large ceramic capacitors (i.e., greater than 2.2 μ F) are often available in low-cost Y5V and Z5U dielectrics, but capacitors greater than 1 μ F are not typically required for AAT3169 applications.

Capacitor area is another contributor to ESR. Capacitors that are physically large will have a lower ESR when compared to an equivalent material smaller capacitor. These larger devices can improve circuit transient response when compared to an equal value capacitor in a smaller package size.

Ordering Information

Package	Marking ¹	Part Number (Tape and Reel) ²
STDFN33-14	UNXYY	AAT3169IFO-T1
QFN44-16	RVXYY	AAT3169ISN-T1

All AnalogicTech products are offered in Pb-free packaging. The term “Pb-free” means semiconductor products that are in compliance with current RoHS standards, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. For more information, please visit our website at <http://www.analogictech.com/about/quality.aspx>.

Package Information³

STDFN33-14

All dimensions in millimeters.

1. XYY = assembly and date code.
 2. Sample stock is generally held on part numbers listed in **BOLD**.
 3. The leadless package family, which includes QFN, TQFN, DFN, TDFN and STDFN, has exposed copper (unplated) at the end of the lead terminals due to the manufacturing process. A solder fillet at the exposed copper edge cannot be guaranteed and is not required to ensure a proper bottom solder connection.

QFN44-16

All dimensions in millimeters.
