# Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note: Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

Renesas Technology Corp. Customer Support Dept. April 1, 2003

# 38C3 Group

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

#### DESCRIPTION

The 38C3 group is the 8-bit microcomputer based on the 740 family core technology.

The 38C3 group has a LCD drive control circuit, a 10-channel A-D converter, and a Serial I/O as additional functions.

The various microcomputers in the 38C3 group include variations of internal memory size and packaging. For details, refer to the section on part numbering.

For details on availability of microcomputers in the 38C3 group, refer to the section on group expansion.

#### **FFATURES**

| ●LCD drive control circuit   |
|--|
| Bias 1/1, 1/2, 1/3   |
| Duty 1/1, 1/2, 1/3, 1/4  |
| Common output  |
| Segment output   |
| ●2 Clock generating circuit  |
| (connect to external ceramic resonator or quartz-crystal oscillator) |
| ●Power source voltage  |
| In high-speed mode4.0 to 5.5 V                                       |
| In middle-speed mode   |
| In low-speed mode  |
| ● Power dissipation  |
| In high-speed mode   |
| (at 8 MHz oscillation frequency)                                     |
| In low-speed mode45 μW   |
| (at 32 kHz oscillation frequency, at 3 V power source voltage)       |
| ● Operating temperature range – 20 to 85°C                           |

#### **APPLICATIONS**

Camera, household appliances, consumer electronics, etc.

I/O direction register allows each pin to be individually programmed as either input or output.     Pull-up control is enabled. | A-D conversion input pins                          |
| P70/XCOUT,<br>P71/XCIN             | I/O port P7   | 2-bit I/O port.     CMOS compatible input level.     CMOS 3-state output structure.     I/O direction register allows each pin to be individually programmed as either input or output.     Pull-up control is enabled. | Sub-clock generating circuit I/O pins              |
| P80 – P87                          | I/O port P8   | 8-bit I/O port.     TTL input level.     CMOS 3-state output structure.     I/O direction register allows each pin to be individually programmed as either input or output.     Pull-up control is enabled.             | Key input (Key-on wake-up) interrupt<br>input pins |

#### **PART NUMBERING**

Fig. 3 Part numbering

#### **GROUP EXPANSION**

Mitsubishi plans to expand the 38C3 group as follows.

# **Memory Type**

Support for mask ROM, One Time PROM, and EPROM versions

# **Memory Size**

| ROM/PROM size | 16 K to | 48 K bytes |
|---------------|---------|------------|
| RAM size      | 512 to  | 1024 bytes |

# **Packages**

Fig. 4 Memory expansion plan

Currently planning products are listed below.

Table 3 Support products

As of April 1998

| Product name   | (P) ROM size (bytes)<br>ROM size for User in ( ) | RAM size<br>(bytes) | Package | Remarks                       |
|----------------|--|---------------------|---------|-------------------------------|

# FUNCTIONAL DESCRIPTION CENTRAL PROCESSING UNIT (CPU)

The 38C3 group uses the standard 740 family instruction set. Refer to the table of 740 family addressing modes and machine instructions or the 740 Family Software Manual for details on the instruction set

Machine-resident 740 family instructions are as follows:

The FST and SLW instruction cannot be used.

The STP, WIT, MUL, and DIV instruction can be used.

# [CPU Mode Register (CPUM)] 003B16

The CPU mode register contains the stack page selection bit and the internal system clock selection bit.

The CPU mode register is allocated at address 003B16.

Fig. 5 Structure of CPU mode register

# **MEMORY**

# Special Function Register (SFR) Area

The Special Function Register area in the zero page contains control registers such as I/O ports and timers.

#### RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

#### **ROM**

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing and the rest is user area for storing programs.

# **Interrupt Vector Area**

The interrupt vector area contains reset and interrupt vectors.

#### **Zero Page**

Access to this area with only 2 bytes is possible in the zero page addressing mode.

# **Special Page**

Access to this area with only 2 bytes is possible in the special page addressing mode.

# I/O PORTS [Direction Registers (ports P2, P4, P50, P52–P57, and P6–P8)]

The I/O ports P2, P4, P50, P52–P57, and P6–P8 have direction registers which determine the input/output direction of each individual pin. Each bit in a direction register corresponds to one pin, each pin can be set to be input port or output port.

When "0" is written to the bit corresponding to a pin, that pin becomes an input pin. When "1" is written to that bit, that pin becomes an output pin.

If data is read from a pin set to output, the value of the port output latch is read, not the value of the pin itself. Pins set to input are floating. If a pin set to input is written to, only the port output latch is written to and the pin remains floating.

# [Direction Registers (ports P0 and P1)]

Ports P0 and P1 have direction registers which determine the input/output direction of each individual port.

Each port in a direction register corresponds to one port, each port can be set to be input or output.

When "0" is written to the bit 0 of a direction register, that port becomes an input port. When "1" is written to that port, that port becomes an output port. Bits 1 to 7 of ports P0 and P1 direction registers are not used.

# Pull-up/Pull-down Control

By setting the PULL register A (address 001616) or the PULL register B (address 001716), ports except for ports P3 and P51 can control either pull-down or pull-up (pins that are shared with the segment output pins for LCD are pull-down; all other pins are pull-up) with a program.

However, the contents of PULL register A and PULL register B do not affect ports programmed as the output ports.

# **Port P8 Output Selection**

Ports P80 to P87 can be switched to N-channel open-drain output by setting "1" to the port P8 output selection register.

Notes 1: Make sure that the input level at each pin is either 0 V or Vcc during execution of the STP instruction.

When an input level is at an intermediate potential, a current will flow from Vcc to Vss through the input-stage gate.

2: For details of the functions of ports P0 to P3 in modes other than single-chip mode, and how to use double function ports as function I/O ports, refer to the applicable sections.

#### **INTERRUPTS**

Interrupts occur by sixteen sources: six external, nine internal, and one software.

# **Interrupt Control**

Each interrupt except the BRK instruction interrupt have both an interrupt request bit and an interrupt enable bit, and is controlled by the interrupt disable flag. An interrupt occurs if the corresponding interrupt request and enable bits are "1" and the interrupt disable flag is "0"

Interrupt enable bits can be set or cleared by software. Interrupt request bits can be cleared by software, but cannot be set by software. The BRK instruction interrupt and reset cannot be disabled with any flag or bit. The I flag disables all interrupts except the BRK instruction interrupt and reset. If several interrupts requests occurs at the same time the interrupt with highest priority is accepted first.

#### **Interrupt Operation**

By acceptance of an interrupt, the following operations are automatically performed:

- 1. The processing being executed is stopped.
- 2. The contents of the program counter and processor status register are automatically pushed onto the stack.
- The interrupt disable flag is set and the corresponding interrupt request bit is cleared.
- The interrupt jump destination address is read from the vector table into the program counter.

#### ■Notes on Interrupts

When the active edge of an external interrupt (INT0 – INT2, CNTR0 or CNTR1) is set or an vector interrupt source where several interrupt source is assigned to the same vector address is switched, the corresponding interrupt request bit may also be set. Therefore, take following sequence:

- (1) Disable the interrupt.
- (2) Change the active edge in interrupt edge selection register.
- (3) Clear the set interrupt request bit to "0."
- (4) Enable the interrupt.

Table 6 Interrupt vector addresses and priority

| Interrupt Source               | Priority | Vector Addres | sses (Note 1) | Interrupt Request  | Remarks   |
|--------------------------------|----------|---------------|---------------|--|---|
| interrupt Source               | Filolity | High          | Low           | Generating Conditions  | Remarks   |
| Reset (Note 2)                 | 1        | FFFD16        | FFFC16        | At reset   | Non-maskable                                    |

| Timer 5                        | 11       | FFE916        | FFE816        | At timer 5 underflow   |   |
| Timer 6                        | 12       | FFE716        | FFE616        | At timer 6 underflow   |   |
| CNTR <sub>0</sub>              | 13       | FFE516        | FFE416        | At detection of either rising or falling edge of CNTRo input | External interrupt (active edge selectable)     |
| CNTR <sub>1</sub>              | 14       | FFE316        | FFE216        | At detection of either rising or falling edge of CNTR1 input | External interrupt (active edge selectable)     |
| Key input (Key-<br>on wake-up) | 15       | FFE116        | FFE016        | At falling of port P8 (at input) input logical level AND     | External interrupt (falling valid)              |
| A-D conversion                 | 16       | FFDF16        | FFDE16        | At completion of A-D conversion                              | Valid when A-D conversion interrupt is selected |
| BRK instruction                | 17       | FFDD16        | FFDC16        | At BRK instruction execution                                 | Non-maskable software interrupt                 |

Notes 1: Vector addresses contain interrupt jump destination addresses.

<sup>2:</sup> Reset function in the same way as an interrupt with the highest priority.

Fig. 13 Interrupt control

Fig. 14 Structure of interrupt-related registers

# **Key Input Interrupt (Key-on Wake-Up)**

A key input interrupt request is generated by applying "L" level to any pin of port P8 that have been set to input mode. In other words, it is generated when AND of input level goes from "1" to "0". An example

of using a key input interrupt is shown in Figure 15, where an interrupt request is generated by pressing one of the keys consisted as an active-low key matrix which inputs to ports P80–P83.

Fig. 15 Connection example when using key input interrupt and port P8 block diagram

# TIMERS 8-Bit Timer

The 38C3 group has six built-in timers: Timer 1, Timer 2, Timer 3, Timer 4. Timer 5, and Timer 6.

Each timer has the 8-bit timer latch. All timers are down-counters. When the timer reaches "0016," an underflow occurs with the next count pulse. Then the contents of the timer latch is reloaded into the timer and the timer continues down-counting. When a timer underflows, the interrupt request bit corresponding to that timer is set to "1."

The count can be stopped by setting the stop bit of each timer to "1." The system clock  $\phi$  can be set to either the high-speed mode or low-speed mode with the CPU mode register. At the same time, timer internal count source is switched to either f(XIN) or f(XCIN).

#### Timer 1, Timer 2

The count sources of timer 1 and timer 2 can be selected by setting the timer 12 mode register. A rectangular waveform of timer 1 underflow signal divided by 2 is output from the P41/T10UT pin. The waveform polarity changes each time timer 1 overflows. The active edge of the external clock CNTRo can be switched with the bit 6 of the interrupt edge selection register.

At reset or when executing the STP instruction, all bits of the timer 12 mode register are cleared to "0," timer 1 is set to "FF16," and timer 2 is set to "0116."

#### ●Timer 3, Timer 4

The count sources of timer 3 and timer 4 can be selected by setting the timer 34 mode register. A rectangular waveform of timer 3 underflow signal divided by 2 is output from the P42/T30UT pin. The waveform polarity changes each time timer 3 overflows. The active edge of the external clock CNTR1 can be switched with the bit 7 of the interrupt edge selection register.

#### ●Timer 5. Timer 6

The count sources of timer 5 and timer 6 can be selected by setting the timer 56 mode register. A rectangular waveform of timer 6 underflow signal divided by 2 can be output from the P52/PWM1 pin.

#### ●Timer 6 PWM1 Mode

Timer 6 can output a rectangular waveform with "H" duty cycle n/ (n+m) from the P52/PWM1 pin by setting the timer 56 mode register (refer to Figure 17). The n is the value set in timer 6 latch (address 002516) and m is the value in the timer 6 PWM register (address 002716). If n is "0," the PWM output is "L," if m is "0," the PWM output is "H" (n = 0 is prior than m = 0). In the PWM mode, interrupts occur at the rising edge of the PWM output.

Fig. 16 Structure of Timer Related Register

Fig. 17 Block diagram of timer

Fig. 18 Timing chart of timer 6 PWM1 mode

#### 16-bit Timer

Timer A is a 16-bit timer that can be selected in one of four modes by the timer A mode register and the timer A control register.

#### ●Timer A

The timer A operates as down-count. When the timer contents reach "000016", an underflow occurs at the next count pulse and the timer latch contents are reloaded. After that, the timer continues count-down. When the timer underflows, the interrupt request bit corresponding to the timer A is set to "1".

### (1) Timer mode

The count source can be selected by setting the timer A mode regis-

# (2) Pulse output mode

Pulses of which polarity is inverted each time the timer underflows are output from the TAOUT pin. Except for that, this mode operates just as in the timer mode.

When using this mode, set port P50 sharing the TAOUT pin to output mode.

# (3) IGBT output mode

After dummy output from the TAOUT pin, count starts with the INT0 pin input as a trigger. When the trigger is detected or the timer A underflows, "H" is output from the the TAOUT pin.

When the count value corresponds with the compare register value, the TAOUT output becomes "L". When the INTo signal becomes "H", the TAOUT output is forced to become "L".

After noise is cleared by noise filters, judging continuous 4-time same levels with sampling clocks to be signals, the INTo signal can use 4

types of delay time by a delay circuit.

When using this mode, set port P55 sharing the INTo pin to input mode and set port P50 sharing the TAOUT pin to output mode. It is possible to force the timer A output to be "L" using pins INT1 and

INT2 by the timer A control register.

### (4) PWM mode

IGBT dummy output, an external trigger with the INTo pin and output control with pins INT1 and INT2 are not used. Except for those, this mode operates just as in the IGBT output mode.

The period of PWM waveform is specified by the timer A set value. The "H" term is specified by the compare register set value.

When using this mode, set port P50 sharing the TAOUT pin to output mode.

Fig. 19 Block diagram of timer A

Fig. 20 Structure of timer A related registers

Fig. 21 Timing chart of timer A PWM, IGBT output modes

#### ■Notes on Timer A

#### (1) Write order to timer A

- In the timer and pulse output modes, write to the timer A register (low-order) first and to the timer A register (high-order) next. Do not write to only one side.
- In the IGBT and PWM modes, write to the registers as follows: the compare register (high- and low-order) the timer A register (low-order)

the timer A register (high-order).

It is possible to use whichever order to write to the compare register (high- and low-order). However, write both the compare register and the timer A register at the same time.

# (2) Read order to timer A

- In all modes, read to the timer A register (high-order) first and to the timer A register (low-order) next. Read order to the compare register is not specified.
- If reading to the timer A register during write operation or writing to it during read operation, normal operation will not be performed.

#### (3) Write to timer A

 When writing a value to the timer A address to write to the latch only, the value is set into the reload latch and the timer is updated at the next underflow. Normally, when writing a value to the timer A address, the value is set into the timer and the timer latch at the same time, because they are written at the same time.

When writing to the latch only, if the write timing to the high-order reload latch and the underflow timing are almost the same, an expected value may be set in the high-order counter.

Do not switch the timer count source during timer count operation.
 Stop the timer count before switching it. Additionally, when performing write to the latch and the timer at the same time, the timer count value may change large.

#### (4) Set of timer A mode register

Set the write control bit to "1" (write to the latch only) when setting the IGBT and PWM modes.

Output waveform simultaneously reflects the contents of both registers at the next underflow after writing to the timer A register (high-order).

### (5) Output control function of timer A

When using the output control function (INT1 and INT2) in the IGBT mode, set the levels of INT1 and INT2 to "H" in the falling edge active or to "L" in the rising edge active before switching to the IGBT mode.

#### SERIAL I/O

The 38C3 group has a built-in 8-bit clock synchronous serial I/O. The

I/O pins of serial I/O also operate as I/O port P4, and their function is selected by the serial I/O control register 1 (address 001916).

Fig. 22 Block diagram of serial I/O

# [Serial I/O Control Registers 1, 2 (SIOCON1, SIOCON2)] 001916, 001A16

Each of the serial I/O control registers 1, 2 contains 8 bits that select various control parameters of serial I/O.

#### ●Operation in serial I/O mode

Either an internal clock or an external clock can be selected as the synchronous clock for serial I/O transfer. A dedicated divider is built-in as the internal clock, giving a choice of six clocks.

When internal clock is selected, serial I/O starts to transfer by a write signal to the serial I/O register (address 001B16). After 8 bits have been transferred, the Sout pin goes to high impedance.

When external clock is selected, the clock must be controlled externally because the contents of the serial I/O register continue to shift while the transfer clock is input. In this case, the SOUT pin does not go to high impedance at the completion of data transfer.

The interrupt request bit is set at the end of the transfer of 8 bits, regardless of whether the internal or external clock is selected.

Fig. 23 Structure of serial I/O control register

Fig. 24 Serial I/O timing (for LSB first)

#### A-D CONVERTER

The 38C3 group has a 10-bit A-D converter. The A-D converter performs successive approximation conversion.

# [A-D Conversion Register (AD)] 003316, 003416

One of these registers is a high-order register, and the other is a low-order register. The high-order 8 bits of a conversion result is stored in the A-D conversion register (high-order) (address 003416), and the low-order 2 bits of the same result are stored in bit 7 and bit 6 of the A-D conversion register (low-order) (address 003316).

During A-D conversion, do not read these registers.

# [A-D Control Register (ADCON)] 003216

This register controls A-D converter. Bits 2 to 0 are analog input pin selection bits. Bit 4 is an AD conversion completion bit and "0" during A-D conversion. This bit is set to "1" upon completion of A-D conversion.

A-D conversion is started by setting "0" in this bit.

# [Comparison Voltage Generator]

The comparison voltage generator divides the voltage between AVSS and VREF, and outputs the divided voltages.

# [Channel Selector]

The channel selector selects one of the input ports P67/AN7–P60/AN0 and inputs it to the comparator.

# [Comparator and Control Circuit]

The comparator and control circuit compares an analog input voltage with the comparison voltage and stores the result in the A-D conversion register. When an A-D conversion is completed, the control circuit sets the AD conversion completion bit and the AD conversion interrupt request bit to "1."

Note that the comparator is constructed linked to a capacitor, so set f(XIN) to at least 500 kHz during A-D conversion. Use a CPU system clock dividing the main clock XIN as the internal system clock.

Fig. 25 Structure of A-D control register

Fig. 26 Block diagram of A-D converter

#### LCD DRIVE CONTROL CIRCUIT

The 38C3 group has the built-in Liquid Crystal Display (LCD) drive control circuit consisting of the following.

- · LCD display RAM
- Segment output enable register
- LCD mode register
- Selector
- Timing controller
- Common driver
- Segment driver
- · Bias control circuit

A maximum of 32 segment output pins and 4 common output pins can be used.

Up to 128 pixels can be controlled for a LCD display. When the LCD enable bit is set to "1" after data is set in the LCD mode register, the

segment output enable register, and the LCD display RAM, the LCD drive control circuit starts reading the display data automatically, performs the bias control and the duty ratio control, and displays the data on the LCD panel.

Table 7 Maximum number of display pixels at each duty ratio

| Duty ratio | Maximum number of display pixels       |
|------------|--|
| 1          | 32 dots<br>or 8 segment LCD 4 digits   |
| 2          | 64 dots<br>or 8 segment LCD 8 digits   |
| 3          | 96 dots<br>or 8 segment LCD 12 digits  |
| 4          | 128 dots<br>or 8 segment LCD 16 digits |

Fig. 27 Structure of LCD related registers

Fig. 28 Block diagram of LCD controller/driver

# **Bias Control and Applied Voltage to LCD Power Input Pins**

To the LCD power input pins (VL1-VL3), apply the voltage value shown in Table 8 according to the bias value.

Select a bias value by the bias control bit (bit 2 of the LCD mode register).

# **Common Pin and Duty Ratio Control**

The common pins (COMo–COM3) to be used are determined by duty ratio.

Select duty ratio by the duty ratio selection bits (bits 0 and 1 of the LCD mode register).

When selecting 1-duty ratio, 1/1 bias can be used.

Table 8 Bias control and applied voltage to VL1-VL3

| Bias value                 | Voltage value                            |
|----------------------------|--|
| 1/3 bias                   | VL3=VLCD<br>VL2=2/3 VLCD<br>VL1=1/3 VLCD |
| 1/2 bias                   | VL3=VLCD<br>VL2=VL1=1/2 VLCD             |
| 1/1 bias<br>(1-duty ratio) | VL3=VLCD<br>VL2=VL1=VSS                  |

Note 1: VLCD is the maximum value of supplied voltage for the LCD panel.

Table 9 Duty ratio control and common pins used

| Duty  | Duty ratio s | selection bit | Common pine used    |  |
|-------|--------------|---------------|---------------------|--|
| ratio | Bit 1        | Bit 0         | Common pins used    |  |
| 1     | 0            | 0             | COMo (Note 1)       |  |
| 2     | 0            | 1             | COMo, COM1 (Note 2) |  |
| 3     | 1            | 0             | COM0-COM2 (Note 3)  |  |
| 4     | 1            | 1             | COMo-COM3           |  |

Notes 1:COM1, COM2, and COM3 are open.
2:COM2 and COM3 are open.

3:COM3 is open.

Fig. 29 Example of circuit at each bias

# **LCD Display RAM**

Address 004016 to 004F16 is the designated RAM for the LCD display. When "1" are written to these addresses, the corresponding segments of the LCD display panel are turned on.

# **LCD Drive Timing**

The LCDCK timing frequency (LCD drive timing) is generated internally and the frame frequency can be determined with the following equation;

$$f(LCDCK) = \frac{(frequency of count source for LCDCK)}{(divider division ratio for LCD)}$$

Frame frequency= 
$$\frac{f(LCDCK)}{duty \ ratio}$$

|                                      | _                                    |                   |                  |                   | _                 |                   |                  |                  |  |

# *ϕ* **CLOCK OUTPUT FUNCTION**

The internal system clock  $\phi$  can be output from port P43 by setting the  $\phi$  output control register. Set "1" to bit 3 of the port P4 direction register when outputting  $\phi$  clock.

Fig. 33 Structure of  $\phi$  output control register

#### ROM CORRECTION FUNCTION

The 38C3 group has the ROM correction function correcting data at the arbitrary addresses in the ROM area.

# [ROM correct address register] 0F0216 - 0F1116

This is the register to store the address performing ROM correction. There are two types of registers to correct up to 8 addresses: one is the register to store the high-order address and the other is to store the low-order address.

# [ROM correct enable register (RC1)] 0F0116

This is the register to enable the ROM correction function. When setting the bit corresponding to the ROM correction address to "1", the ROM correction function is enabled.

It becomes invalid to the addresses of which corresponding bit is "0". All bits are "0" at the initial state.

#### [ROM correct data]

This is the register to store a correct data for the address specified by the ROM correct address register.

#### ■Notes on ROM correction function

- To use the ROM correction function, transfer data to each ROM correct data register in the initial setting.
- Do not specify the same addresses in the ROM correct address register.

#### **RESET CIRCUIT**

To reset the microcomputer,  $\overline{RESET}$  pin should be held at an "L" level for 2  $\mu s$  or more. Then the  $\overline{RESET}$  pin is returned to an "H" level (the power source voltage should be between 2.5 V and 5.5 V, and the oscillation should be stable), reset is released. After the reset is completed, the program starts from the address contained in address FFFD16 (high-order byte) and address FFFC16 (low-order byte). Make sure that the reset input voltage is less than 0.5 V for Vcc of 2.5 V (switching to the high-speed mode, a power source voltage must be between 4.0 V and 5.5 V).

Fig. 39 Internal status at reset

### **CLOCK GENERATING CIRCUIT**

The 38C3 group has two built-in oscillation circuits. An oscillation circuit can be formed by connecting a resonator between XIN and XOUT (XCIN and XCOUT). Use the circuit constants in accordance with the resonator manufacturer's recommended values. No external resistor is needed between XIN and XOUT since a feedback resistor exists on-chip. However, an external feedback resistor is needed between XCIN and XCOUT.

Immediately after power on, only the XIN oscillation circuit starts oscillating, and XCIN and XCOUT pins function as I/O ports.

### Frequency control (1) Middle-speed mode

The internal system clock is the frequency of XIN divided by 8. After reset, this mode is selected.

### (2) High-speed mode

The internal system clock is the frequency of XIN divided by 2.

### (3) Low-speed mode

The internal system clock is the frequency of XCIN divided by 2.

### ■Notes on clock generating circuit

If you switch the mode between middle/high-speed and low-speed, stabilize both XIN and XCIN oscillations. The sufficient time is required for the sub clock to stabilize, especially immediately after power on and at returning from stop mode. When switching the mode between middle/high-speed and low-speed, set the frequency on condition that f(XIN) > 3f(XCIN).

### Oscillation control

### (1) Stop mode

If the STP instruction is executed, the internal system clock stops at an "H" level, and XIN and XCIN oscillators stop. Timer 1 is set to "FF16" and timer 2 is set to "0116."

Either XIN divided by 16 or XCIN divided by 16 is input to timer 1 as count source, and the output of timer 1 is connected to timer 2. The bits of the timer 12 mode register are cleared to "0." Set the interrupt enable bits of the timer 1 and timer 2 to disabled ("0") before executing the STP instruction. Oscillator restarts when an external interrupt is received, but the internal system clock is not supplied to the CPU until timer 2 underflows. This allows time for the clock circuit oscillation to stabilize.

### (2) Wait mode

If the WIT instruction is executed, the internal system clock stops at an "H" level. The states of XIN and XCIN are the same as the state before executing the WIT instruction. The internal system clock restarts at reset or when an interrupt is received. Since the oscillator does not stop, normal operation can be started immediately after the clock is restarted.

### NOTES ON PROGRAMMING Processor Status Register

The contents of the processor status register (PS) after a reset are undefined, except for the interrupt disable flag (I) which is "1." After a reset, initialize flags which affect program execution. In particular, it is essential to initialize the index X mode (T) and the decimal mode (D) flags because of their effect on calculations.

### Interrupts

The contents of the interrupt request bits do not change immediately after they have been written. After writing to an interrupt request register, execute at least one instruction before performing a BBC or BBS instruction.

### **Decimal Calculations**

- To calculate in decimal notation, set the decimal mode flag (D) to "1," then execute an ADC or SBC instruction. After executing an ADC or SBC instruction, execute at least one instruction before executing a SEC, CLC, or CLD instruction.
- In decimal mode, the values of the negative (N), overflow (V), and zero (Z) flags are invalid.

#### **Timers**

If a value n (between 0 and 255) is written to a timer latch, the frequency division ratio is 1/(n+1).

### **Multiplication and Division Instructions**

- The index X mode (T) and the decimal mode (D) flags do not affect the MUL and DIV instruction.
- The execution of these instructions does not change the contents of the processor status register.

### **Ports**

The contents of the port direction registers cannot be read. The following cannot be used:

- The data transfer instruction (LDA, etc.)
- The operation instruction when the index X mode flag (T) is "1"
- The addressing mode which uses the value of a direction register as an index
- The bit-test instruction (BBC or BBS, etc.) to a direction register
- The read-modify-write instructions (ROR, CLB, or SEB, etc.) to a direction register.

Use instructions such as LDM and STA, etc., to set the port direction registers.

### Serial I/O

• Using an external clock

When using an external clock, input "H" to the external clock input pin and clear the serial I/O interrupt request bit before executing serial I/O transfer and serial I/O automatic transfer.

• Using an internal clock

When using an internal clock, set the synchronous clock to the internal clock, then clear the serial I/O interrupt request bit before executing a serial I/O transfer and serial I/O automatic transfer.

### A-D Converter

The comparator uses internal capacitors whose charge will be lost if the clock frequency is too low.

Therefore, make sure that f(XIN) is at least on 500 kHz during an A-D conversion.

Do not execute the STP or WIT instruction during an A-D conversion.

### **Instruction Execution Time**

The instruction execution time is obtained by multiplying the frequency of the internal system clock by the number of cycles needed to execute an instruction.

The number of cycles required to execute an instruction is shown in the list of machine instructions.

The frequency of the internal system clock is the same half of the XIN frequency in high-speed mode.

### At STP Instruction Release

At the STP instruction release, all bits of the timer 12 mode register are cleared.

### NOTES ON USE Notes on Built-in EPROM Version

The P51 pin of the One Time PROM version or the EPROM version functions as the power source input pin of the internal EPROM.

Therefore, this pin is set at low input impedance, thereby being affected easily by noise.

To prevent a malfunction due to noise, insert a resistor (approx. 5 k $\Omega$ ) in series with the P51 pin.

### DATA REQUIRED FOR MASK ORDERS

The following are necessary when ordering a mask ROM production:

- 1. Mask ROM Order Confirmation Form
- 2. Mark Specification Form
- 3. Data to be written to ROM, in EPROM form (three identical copies)

### DATA REQUIRED FOR ROM WRITING ORDERS

The following are necessary when ordering a ROM writing:

- 1. ROM Writing Confirmation Form
- 2. Mark Specification Form
- 3. Data to be written to ROM, in EPROM form (three identical copies)

### **ROM PROGRAMMING METHOD**

The built-in PROM of the blank One Time PROM version and built-in EPROM version can be read or programmed with a general-purpose PROM programmer using a special programming adapter.

Table 10 Programming adapter

| Package | Name of Programming Adapter |
|---------|-----------------------------|
| 80P6N-A | PCA4738F-80A                |
| 80D0    | PCA4738L-80A                |

The PROM of the blank One Time PROM version is not tested or screened in the assembly process and following processes. To ensure proper operation after programming, the procedure shown in Figure 44 is recommended to verify programming.

Fig. 44 Programming and testing of One Time PROM version

**Notes 1:** The total output current is the sum of all the currents flowing through all the applicable ports. The total average current is an average value measured over 100 ms. The total peak current is the peak value of all the currents.

<sup>2:</sup> The peak output current is the peak current flowing in each port.

<sup>3:</sup> The average output current is average value measured over 100 ms.

Table 14 Recommended operating conditions (Vcc = 2.5 to 5.5 V, Ta = -20 to 85°C, unless otherwise noted)

| Cumbal                | Description  |  |  | Unit   |           |       |
|-----------------------|--|--|--|--------|-----------|-------|
| Symbol                | Parameter  |  |  | Тур.   | Max.      | Offic |
| f(CNTR <sub>0</sub> ) | Input frequency (duty cycle 50%)                   | (4.0 V ≤ VCC ≤ 5.5 V)  |  |        | 4.0       | MHz   |
| f(CNTR1)              |  | (Vcc ≤ 4.0 V)  |  |        | (2XVcc)-4 | MHz   |
| f(XIN)                | Main clock input oscillation frequency (Note 4)    | High-speed mode $(4.0 \text{ V} \le \text{Vcc} \le 5.5 \text{ V})$ |  |        | 8.0       | MHz   |
|                       |  | High-speed mode (Vcc ≤ 4.0 V)                                      |  |        | (4XVcc)-8 | MHz   |
|                       |  | Middle-speed mode  |  |        | 8.0       | MHz   |
| f(XCIN)               | Sub-clock input oscillation frequency (Notes 4, 5) |  |  | 32.768 | 50        | kHz   |

Notes 4: When the oscillation frequency has a duty cycle of 50%.

<sup>5:</sup> When using the microcomputer in low-speed mode, set the sub-clock input oscillation frequency on condition that f(XCIN) < f(XIN)/3.

### # 1. Confirmation

Specify the name of the product being ordered and the type of EPROMs submitted.

Three EPROMs are required for each pattern.

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

Checksum code for entire EPROM

|  | 4 |  |
|--|---|--|
|  |   |  |

(hexadecimal notation)

### EPROM type (indicate the type used)

| □ 27256  |                             |                            | 27512                       |
|--|-----------------------------|----------------------------|-----------------------------|

# 740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M38C34M6AXXXFP MITSUBISHI ELECTRIC

We recommend the use of the following pseudo-command to set the start address of the assembler source program because ASCII codes of the product name are written to addresses 000016 to 000816 of EPROM.

| EPROM type         | 27256                          | 27512                          |
|--------------------|--------------------------------|--------------------------------|
| The pseudo-command | *=Δ\$8000<br>.BYTEΔ'M38C34M6A' | *=∆\$0000<br>.BYTE∆'M38C34M6A' |

Note: If the name of the product written to the EPROMs does not match the name of the mask ROM confirmation form, the ROM will not be processed.

### \* 2. Mark specification

Mark specification must be submitted using the correct form for the package being ordered. Fill out the appropriate mark specification form (80P6N) and attach it to the mask ROM confirmation form.

| <ul> <li>* 3. Usage conditions Please answer the following questions a (1) How will you use the XIN-ΧΟυΤ oscillator?</li> </ul> | bout usage for use in our product inspection : |
|---|--|
| Ceramic resonator   | ☐ Quartz crystal                               |
| <ul><li>External clock input</li></ul>  | Other ( )                                      |
| At what frequency?  | $f(X_{IN}) = MHz$                              |
| (2) Which function will you use the P7 <sub>0</sub> /XcIN a   | nd P7 <sub>0</sub> /Xcout pins?                |
| □ Port P7₀ and P7₁ function   | ☐ Xcin-Xcout function (external resonator)     |

### # 1. Confirmation

Specify the name of the product being ordered and the type of EPROMs submitted.

Three EPROMs are required for each pattern.

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

| Checksum cod | a for an | tiro EDD | $\cap$ |
|--------------|----------|----------|--------|

|  | 1 |
|--|---|
|  |   |
|  |   |

(hexadecimal notation)

### EPROM type (indicate the type used)

|  | 27256                                | 27512  |                                      |  |
|--|--------------------------------------|--|--------------------------------------|--|

### 80P6N (80-PIN QFP) MARK SPECIFICATION FORM

| Mitsubishi IC catalog name |  |
|----------------------------|--|
|                            |  |

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

### A. Standard Mitsubishi Mark

B. Customer's Parts Number + Mitsubishi IC Catalog Name

Customer's Parts Number

Note: The fonts and size of characters are standard Mitsubishi type.

Mitsubishi IC catalog name

Notes 1: The mark field should be written right aligned.

2: The fonts and size of characters are standard Mitsubishi type.

### C. Special Mark Required

Notes1: If special mark is to be printed, indicate the desired layout of the mark in the left figure. The layout will be duplicated technically as close as possible.

Mitsubishi product number (6-digit, or 7-digit) and Mask ROM number (3-digit) are always marked for sorting the products.

2 : If special character fonts (e,g., customer's trade mark logo) must be used in Special Mark, check the box below.

For the new special character fonts, a clean font original (ideally logo drawing) must be submitted.

Special character fonts required

### Renesas Technology Corp.

### Keep safety first in your circuit designs!

Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placemer substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

- Notes regarding these materials

  These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.

  Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.

  All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.

  Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.

  The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.

  If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.

- approved destination.

  Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.

  Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
