

## 1 Hz to 102.4 kHz 8-Bit Programmable

## 2" x 2" 4-Pole Filters

### Description

The 824 Series are digitally programmable low pass and high pass active filters that are tunable over a 256:1 frequency range. 824 filters are available with any one of five standard factory-set tuning ranges up to 102.4 kHz. These units contain 8 CMOS logic inputs .

All 824 Series models are convenient, low profile, easy to use fully finished filters which require no external components or adjustments. They feature low harmonic distortion, and near theoretical phase and amplitude characteristics. 824 filters operate from non-critical  $\pm 12$  to  $\pm 18$  Vdc power supplies, have a 10 k $\Omega$  (min.) input impedance, a 10  $\Omega$  (max.) output.

### Features/Benefits:

- Compact 2" x 2" design minimizes board space requirements.
- Digitally programmable corner frequency allows selecting cut-off frequencies specific to each application.
- Plug-in ready-to-use, reducing engineering design and manufacturing cycle time.
- Factory-set tuning range, no external clocks or adjustments needed.
- Broad range of transfer characteristics and corner frequencies to meet a wide range of applications.

### Applications

- Anti-alias filtering
- Data acquisition systems
- Communication systems and electronics
- Medical electronics equipment and research
- Aerospace, navigation and sonar applications
- Sound and vibration testing
- Real and compressed time data analysis
- Noise elimination
- Signal reconstruction

## Digital Tuning & Control Characteristics

### 8-Bit Programmable Filters

#### Digital Tuning Characteristics

The digital tuning interface circuits are a parallel set of eight (8) 4053 CMOS switches which accept CMOS compatible inputs for the eight tuning bits (D<sub>0</sub> - D<sub>7</sub>).

Filter tuning follows the tuning equation given below:

$$f_c = ( f_{max}/256 ) [ 1 + D_7 \times 2^7 + D_6 \times 2^6 + D_5 \times 2^5 + D_4 \times 2^4 + D_3 \times 2^3 + D_2 \times 2^2 + D_1 \times 2^1 + D_0 \times 2^0 ]$$

where D<sub>1</sub> - D<sub>7</sub> = "0" or "1", and

f<sub>max</sub> = Maximum tuning frequency;

f<sub>c</sub> = corner frequency;

Minimum tunable frequency = f<sub>max</sub>/256 (D<sub>0</sub> thru D<sub>7</sub> = 0);

Minimum frequency step (Resolution) = f<sub>max</sub>/256

#### Data Input Specifications

##### Input Data Levels (CMOS Logic)

Input Voltage (Vs = 15 Vdc)

Low Level In	0 Vdc min.	4 Vdc max.
High Level In	11 Vdc min.	15 Vdc max.

Input Current

High Level In	- 10 <sup>-5</sup> μA typ.	-1 μA max..
Low Level In	+10 <sup>-5</sup> μA typ.	+1 μA max.

Input Capacitance 5 pF typ 7.5 pF max.

##### Input Data Format Frequency Select Bits

Positive Logic Logic "1" = +Vs  
Logic "0" = Gnd

Bit Weighting (Binary-Coded)  
D<sub>0</sub> LSB (least significant bit)  
D<sub>7</sub> MSB (most significant bit)

Frequency Range 256 : 1, Binary Weighted

#### Pin-Out Key

IN	Analog Input Signal	D <sub>7</sub> Tuning Bit 7 (MSB)

## Specification

(25°C and Vs ± 15 Vdc)

### Analog Input Characteristics<sup>1</sup>

Impedance	10 kΩ min.
Voltage Range	± 10 Vpeak
Max. Safe Voltage	±Vs

### Analog Output Characteristics

Impedance (Closed Loop)	1 Ω typ. 10 Ω max.
Linear Operating Range	± 10V
Maximum Current <sup>2</sup>	± 2 mA
Offset Voltage <sup>3</sup>	2 mV typ. 20 mV max.
Offset Temp. Coeff.	50 μV/°C

### Power Supply (±V)

Rated Voltage	± 15 Vdc
Operating Range	± 12 to ± 18 Vdc
Maximum Safe Voltage	± 18 Vdc
Quiescent Current	
4-Pole	± 13 mA typ. ± 20 mA max.

### Temperature

Operating	0 to +70°C
Storage	-25 to +85°C

#### Notes:

1. Input and output signal voltage referenced to supply common.
2. Output is short circuit protected to common.  
DO NOT CONNECT TO ±Vs.
3. Adjustable to zero.
4. Units operate with or without offset pin connected.

## Programmable Filter Modules Power Sequence & ESD

---

November 2000

### Programmable Filters Modules

818, 824, 828, 828BP, 828BR, 854, 858, R854, R858

#### I. Scope

The following precautions are necessary when handling and installing Frequency Devices programmable filter modules.

#### II. Digital Circuit Description

The digital input pins connect directly to 4000 series CMOS logic, such as the 4053 analog switch. The power supply (V<sub>ss</sub>) for the digital logic on the module comes directly from the +15 Volt pin on the module. This sets the threshold voltage at 11.0 V minimum to 15.0 V maximum for a "1" (High) level and 0.0 V minimum to 4.0 V maximum for a "0" (Low) level. Applying a voltage between 4.0 and 11.0 V will produce unpredictable operation. Connecting 5 Volt or 3.3 V logic devices directly to the filter module without using a voltage translator will result in erratic operation of the filter.

#### III. (VERY IMPORTANT) Power-Up and Power-Down Sequence

**Do not plug-in or un-plug module while power is applied.** It is imperative that power is supplied to the + 15 V pin on the filter module before or at the same instance that any digital pin is pulled High (> 0.0 V). Failure to do this will result in excessive current flowing through the digital input pin and through a protection diode internal to the 4000 logic, which will result in damage to the module. The proper power-up and power-down sequence is:

1. Connect filter module ground.
2. Connect filter module +15 V.
3. Connect filter module -15 V.
4. Connect the input signal.

All four of the above steps can also occur simultaneously. Power-down should occur in the reverse order.

#### IV. ESD Issues

Like most modern electronic equipment, the modules can be damaged by electrostatic discharge (ESD). The modules are shipped from the factory in sealed, anti-static packaging and should be kept in the sealed package prior to mounting on a circuit board. The following additional rules should also be observed when handling the modules after they are removed from the factory packaging:

1. Only a person wearing a properly grounded wrist strap should handle the modules.
2. Any work surface that the modules are placed on must be properly ESD grounded.
3. Any insulating materials capable of generating static charge (such as paper) should be kept away from the modules.

Static generating clothing should be covered with an ESD-protective smock.

**Frequency Response**

**Delay (Normalized)**

**Step Response**

**1. Normalized Group Delay:**

The above delay data is normalized to a corner frequency of 1.0Hz. The actual delay is the normalized delay divided by the actual corner frequency (fc).

$$\text{Actual Delay} = \frac{\text{Normalized Delay}}{\text{Actual Corner Frequency (fc) in Hz}}$$
