The JDSU CT2 Series 2.5 Gb/s Coarse Wavelength Division Multiplexing (CWDM) transceiver integrates optics and electronics in a Small Form Factor Pluggable (SFP) package. It is Multisource Agreement (MSA) compatible and designed for CWDM operation per ITU-T G.695 for unidirectional 8 channel black-link transmission (S-C8S1-1DX and S-C8L1-1DX). Although optimized for 2.5 Gb/s, the CT2 provides multi-rate capabilities and can be used for various protocols ranging from OC-3 (155 Mb/s) up to 2.7 Gb/s including 622 Mb/s, 1x/2x FC, GbE and 2x GbE.

The CT2 Series CWDM SFP transceiver provides a fully G.695 8 channel black-link compliant interface between the optical Mux/Demux photonic layer and the electrical layer. Its microprocessor-based modular design implements all features specified in the SFP MSA compatible 2-wire Serial Digital Diagnostic Monitoring Interface for Optical Transceivers.

The major components in this module include an uncooled distributed feedback (DFB) based optical transmitter, a PIN or APD based optical receiver with integrated transimpedance amplifier (TIA), an APD high voltage circuit (if required), a microprocessor, a limiting post amplifier, and a laser driver. This CWDM transceiver design offers a "hot-pluggable" interface and is available in short haul (40 km, PIN) and long haul (80 km, APD) configurations.

**CT2 Electrical Pad Layout**

**Transceiver Pin Descriptions**

Pin	Description
TD	Un-clocked, multirate, differential serial bit stream (155 Mb/s to 2.7 Gb/s) used to drive the optical transmitter.
TDb	Internally AC coupled and terminated via internal 100 Ω differential impedance.
RD	Differential received electrical signal capable of detecting 155 Mb/s to 2.7 Gb/s bit patterns.
RDb	The differential pair is internally biased and AC coupled. This signal requires 100 Ω external differential termination.
Rate_select	Internally monitored and available for future use. Can be customized for specific applications.
TxDIS	Transmitter Disable Input. A logic HIGH on this input pin disables the transmitter's laser so that there is no optical output. If left open the transmitter will be disabled.
LOS	Loss of Signal (Open Collector). A logic HIGH on this output indicates an incoming signal level that is less than -25 dBm but no greater than -31 dBm for the 40 km configuration and less than -34 dBm but no greater than -40 dBm for the 80 km configuration. LOS shall deassert (logic LOW) when a 3 dB (maximum), 0.5 dB (minimum) hysteresis is obtained.
Tx_fault	Transmitter fault (Open collector). A logic HIGH indicates that the transmitter is in a fault condition.
MOD_DEF(0)	MOD_DEF(0) is internally grounded to indicate the presence of the module. Must be pulled-up on host board with 10 KΩ resistor.
MOD_DEF(1)	MOD_DEF(1) is the clock of the 2 wire interface for module monitoring.
MOD_DEF(2)	MOD_DEF(2) is the data line of the 2 wire interface for module monitoring.
VccR,VccT	Receiver, Transmitter power supply, respectively
VeeR, VeeT	Receiver, Transmitter ground, respectively. The chassis ground and circuit ground isolation is configurable.
