Functional Description

The CY2310ANZ is a 3.3V buffer designed to distribute high speed clocks in mobile PC applications. The part has 10 outputs, eight of which are used to drive up to four SDRAM SO-DIMMs. The remaining are used for external feedback to a PLL. The device operates at 3.3V and outputs can run up to 100 MHz, thus making it compatible with Pentium II® processors. The CY2310ANZ can be used in conjunction with the CY2281 or similar clock synthesizer for a full Pentium II motherboard solution.

The CY2310ANZ also includes a serial interface which can enable or disable each output clock. During power up, all output clocks are enabled. A separate Output Enable pin facilitates testing on ATE.

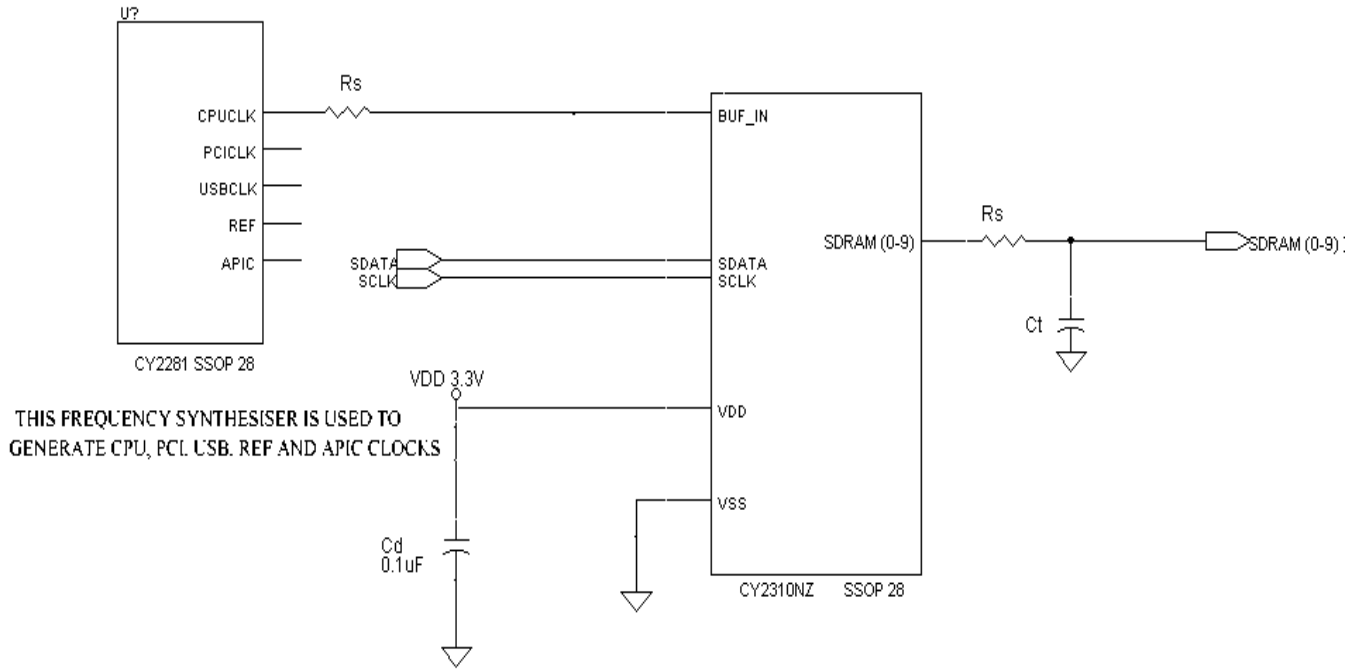
Application Information

Clock traces must be terminated with either series or parallel termination, as is normally done.



Cd = DECOUPLING CAPACITOR

Ct = OPTIONAL EMI-REDUCING CAPACITORS

Rs = SERIES TERMINATING RESISTORS

Summary

- Surface mount, low ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of 0.1 μF. In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where Rtrace is the loaded characteristic impedance of the trace, Rout is the output impedance of the buffer (typically 25Ω), and Rseries is the series terminating resistor.
  Rseries > Rtrace – Rout
- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7 pF to 22 pF.
- A Ferrite Bead **may** be used to isolate the Board V_{DD} from the clock generator V_{DD} island. Ensure that the Ferrite Bead offers greater than 50Ω impedance at the clock frequency, under loaded DC conditions. Please refer to the application note “Layout and Termination Techniques for Cypress Clock Generators” for more details.
- If a Ferrite Bead is used, a 10 μF to 22 μF tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.
