

RoHS Compliant Product

Description

The SLLM317L is a monolithic integral circuit, designed for use as positive adjustable voltage regulator. It is designed to supply unit 100mA of load current with an output voltage adjustable over a 1.25V to 37V range.

Features

- * Thermal Overload Protection
- * Floating Operation For High Voltage Applications
- * Short Circuit Protection
- * Output Voltage Adjustable From 1.25V To 37V
- * Output Transistor Save Area Compensation
- * Output Current In Excess Of 100mA

Application Information and Circuits

The SLLM317L provides an internal reference voltage of 1.25V between the output and adjustments terminals. This is used to set a constant current flow across an external resistor driver, giving an output voltage V_{OUT} of:

$$V_{OUT} = V_{REF} * (1 + R2 / R1) + I_{ADJ} * R2$$

The device is designed to minimize the term I_{ADJ} (100uA max) and to maintain it very constant with line and load charges. Usually, the error term $I_{ADJ} * R2$ can be neglected. To obtain the previous requirement, all the regulator quiescent current is returned to the output terminal, imposing a minimum load current condition. If the load is insufficient, the output voltage will rise. The SLLM317L is a floating regulator, input-output differential voltage, supplies of very high voltage with respect to ground can be regulated as long as the maximum input-output differential is not exceeded. Furthermore, programmable regulators are easily obtainable and, by connecting a fixed resistor between the adjustment and output, the device can be used as a precision current regulator.
