

### Description

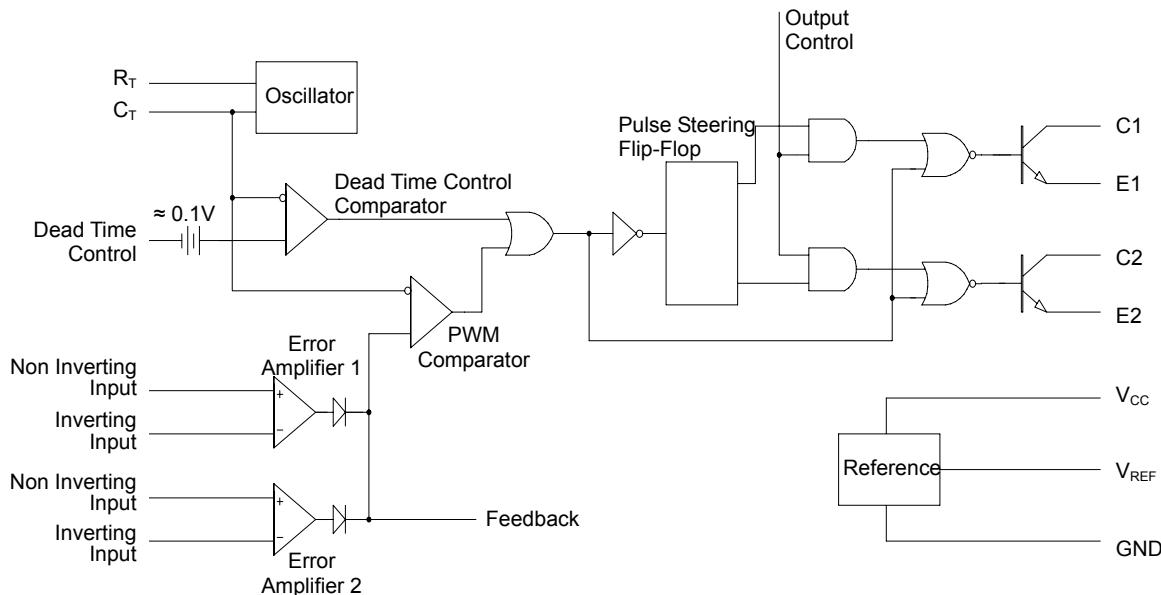

The KA7500 incorporate on a single monolithic chip all the functions required in the construction of a pulse-width-modulation control circuit. Designed primarily for power supply control, these devices offer the systems engineer the flexibility to tailor the power supply control circuitry to his application.

The KA7500 contains an error amplifier, an on-chip adjustable oscillator, a dead-time control comparator, pulse-steering control flipflop, a 5-volt, 1% precision regulator, and output-control circuits. The error amplifier exhibits a common-mode voltage range from -0.3 volts to VCC -2 volts. The dead-time control comparator has a fixed offset that provides approximately 5% dead time when externally altered. The on-chip oscillator may be bypassed by terminating RT (pin 6) to the reference output and providing a sawtooth input to CT (pin 5), or it may be used to drive the common circuits in synchronous multiple-rail power supplies. The uncommitted output transistors provide either common-emitter or emitter-follower output capability. Each device provides for push-pull or single-ended output operation, which may be selected through the output-control function. The architecture of these devices prohibits the possibility of either output being pulsed twice during push-pull operation.

### Features

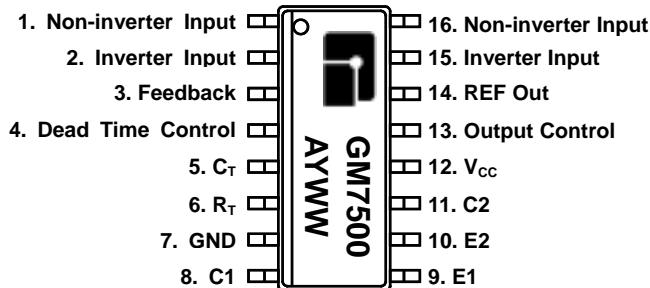

- ◆ High Current totem Pole Output Stage
- ◆ Complete PWM Power Control Circuitry
- ◆ Uncommitted Outputs for 200 mA Sink or Source Current
- ◆ Output Control Selects Single-Ended or Push-Pull Operation
- ◆ Internal Circuitry Prohibits Double Pulse at Either Output
- ◆ Variable Dead-Time Provides Control over Total Range
- ◆ Internal Regulator Provides a Stable 5-V Reference Supply, 1%
- ◆ Circuit Architecture Allows Easy Synchronization

\* For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

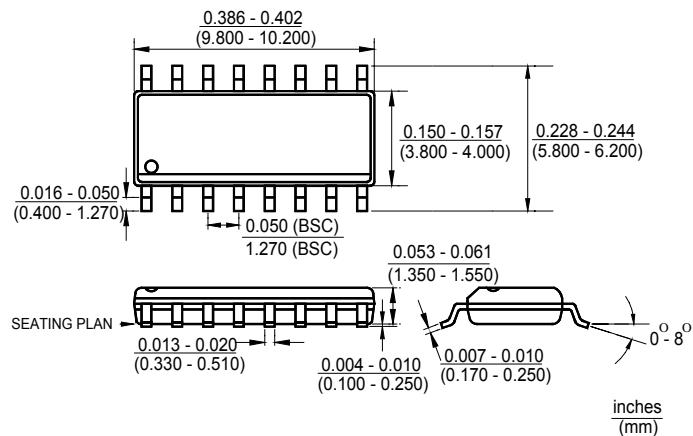

\*\* All typical values except for parameter changes with temperature are at  $TA = 25^\circ\text{C}$

\*\*\* Duration of the short-circuit should not exceed one second

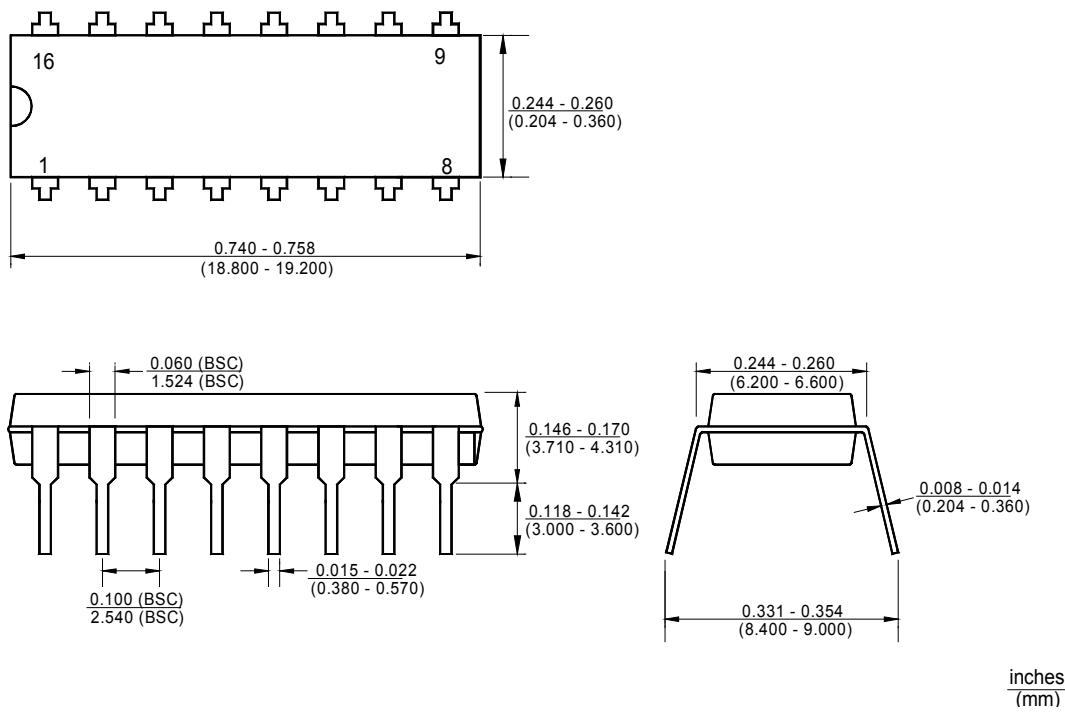

\*\*\*\* This is guaranteed where the marking code on the package surface is "A"

\*\*\*\*\* Temperature coefficient of timing capacitor and timing resistor not taken into account
