

200mA, Dual Channel Ultra-Fast CMOS LDO Regulator

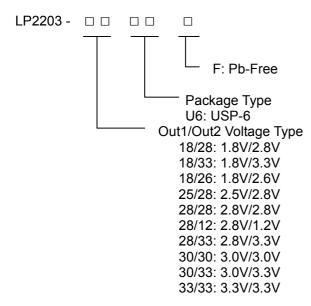

General Description

The LP2203 is a dual channel, low noise, and low dropout regulator sourcing up to 250mA at each channel. The range of output voltage is from 1.2V to 3.6V by operating from 2.5V to 5.5V input.

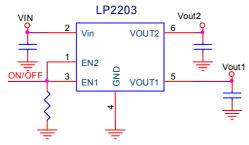

LP2203 offers 2% accuracy, extremely low dropout voltage ($80\text{mV} \otimes 150\text{mA}$), and extremely low ground current, only $25\mu\text{A}$ per LDO. The shutdown current is near zero current which is suitable for battery-power devices. Other features include current limiting, over temperature, output short circuit protection.

LP2203 can operate stably with very small ceramic output capacitors, reducing required board space and component cost. LP2203 is available in fixed output voltages in the USP-6 package.

Ordering Information

Typical Application Circuit

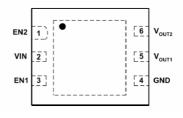

Features

- ◆ Wide Operating Voltage Ranges: 2.5V to 5.5V
- Low-Noise for RF Application
- ♦ High PSRR 65dB at 1kHz
- No Noise Bypass Capacitor Required
- Fast Response in Line/Load Transient
- ◆ TTL-Logic-Controlled Shutdown Input
- ◆ Dual LDO Outputs (200mA/200mA)
- High Output Accuracy 2%
- ◆ Ultra-low Quiescent Current 27uA
- Thermal Shutdown Protection
- ◆ Tiny USP-6 Package
- ◆ RoHS Compliant and 100% Lead (Pb)-Free

Applications

- ♦ CDMA/GSM Cellular Handsets
- ♦ Smart mobile phone
- ♦ Battery-Powered Equipment
- ♦ DSC Sensor
- ♦ Wireless Card

Functional Pin Description

Pin No.	Pin Name	Pin Function		
1	EN2	Chip Enable2 (Active High)		
2	VIN	Supply Input		
3	EN1	Chip Enable1 (Active High)		
4	GND	Common Ground		
5	VOUT1	Channel 1 Output Voltage		
6	VOUT2	Channel2 Output Voltage		

Function Block Diagram

Absolute Maximum Ratings

Supply Input Voltage	6V
Power Dissipation, PD @ TA = 25° C	
USP-6	455mW
Package Thermal Resistance	
USP-6, θJA	220°C/W
Lead Temperature (Soldering, 10 sec.)	260°C
Storage Temperature Range	
ESD Susceptibility	
HBM (Human Body Mode)	2kV
MM(Machine-Mode)	200V
Recommended Operating Conditions	
Operation Junction Temperature Range	
Operation Ambient TemperatureRange	

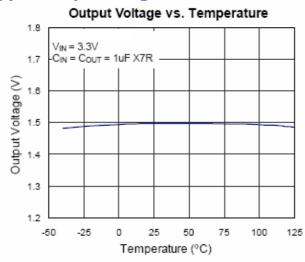

Electrical Characteristics

Thermal Shutdown Temperature		TSD			165		°C		

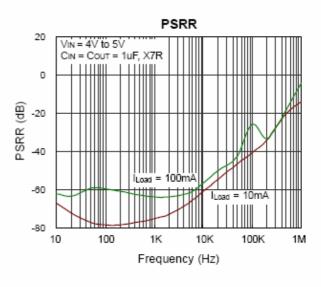

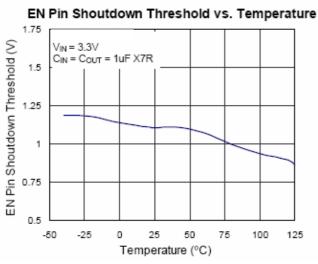

Typical Operating Characteristics

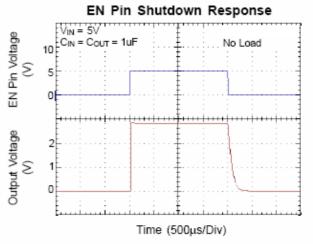

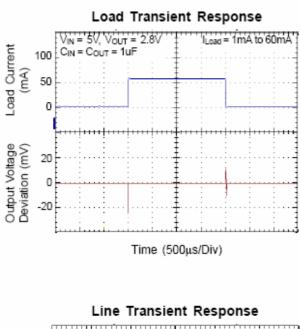

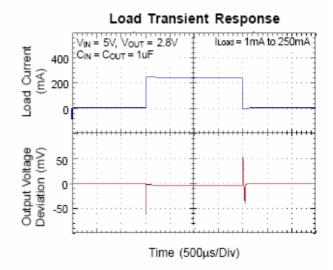

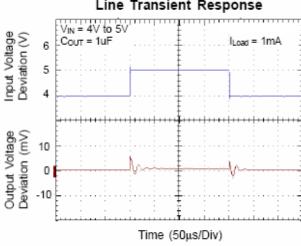

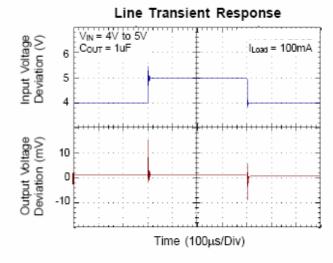

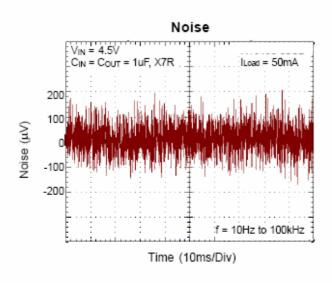

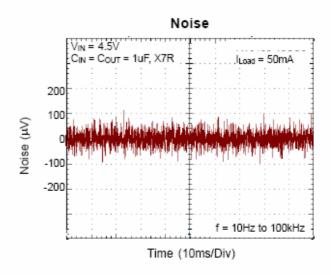

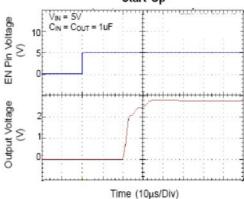

Applications Information

Like any low-dropout regulator, the external capacitors used with the LP2203 must be carefully selected for regulator stability and performance. Using a capacitor whose value is > 1µF on the LP2203 input and the amount of capacitance can be increased without limit. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. Any good quality ceramic or tantalum can be used for this capacitor. The capacitor with larger value and lower ESR (equivalent series resistance) provides better **PSRR** line-transient response. The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDOs application. The LP2203 is designed specifically to work with low ESR ceramic output capacitor in space-saving and performance consideration. Using a ceramic capacitor whose value is at least 1µF with ESR is > $25m\Omega$ on the LP2203 output ensures stability. The LP2203 still works well with output capacitor of other types due to the wide stable ESR range. Figure 1 shows the curves of allowable ESR range as a function of load current for various output capacitor values. Output capacitor of larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located not more than 0.5 inch from the VOUT pin of the LP2203 and returned to a clean analog ground.

Start-up Function Enable Function Start Up

The LP2203 features an LDO regulator enable/disable function. To assure the LDO regulator will switch on, the EN turn on control level must be greater than 1.2 volts. The LDO regulator will go into the shutdown mode when the voltage on the EN pin falls below 0.4 volts. For to protecting the system, the LP2203 have a quick-discharge function. If the enable function is not needed in a specific application, it may be tied to VIN to keep the LDO regulator in a continuously on state.

Thermal Considerations

Thermal protection limits power dissipation in LP2203. When the operation junction temperature exceeds 165°C, the OTP circuit starts the thermal shutdown function turn the pass element off. The pass element turn on again after the junction temperature cools by 30°C. For continue operation, do not exceed absolute maximum operation junction temperature 125°C.

The power dissipation definition in device is :

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient.

The maximum power dissipation can be calculated by following formula:

 $PD(MAX) = (TJ(MAX) - TA)/\theta JA$

Where TJ(MAX) is the maximum operation junction

temperature 125°C, TA is the ambient temperature and the θ JA is the junction to ambient thermal resistance. For recommended operating conditions specification of LP2203, where TJ(MAX) is the maximum junction temperature of the die (125°C) and TA is the maximum ambient temperature. The junction to ambient thermal resistance (θ JA is layout dependent) for USP-6 package is 250°C/W.

 $PD(MAX) = (125^{\circ}C-25^{\circ}C) / 250 = 400 \text{mW} \text{ (USP-6)}$ $PD(MAX) = (125^{\circ}C-25^{\circ}C) / 165 = 606 \text{mW}$

The maximum power dissipation depends on operating ambient temperature for fixed TJ(MAX) and thermal resistance θJA .
