

Professional Thin Film Chip Resistor Superior Moisture Resistivity

Automotive-Grade MC AT Professional Thin Film Chip Resistors are the perfect choice for most fields of modern professional electronics where reliability and stability is of major concern. Typical applications include automotive, telecommunication, industrial, medical equipment, precision test and measuring equipment.

FEATURES

- Operating temperature up to 175 °C for 1000 h
- Superior moisture resistivity, $|\Delta R/R| < 0.5 \%$ (85 °C; 85 % RH; 1000 h)
- Rated dissipation P_{85} up to 0.4 W for size 1206
- AEC-Q200 qualified
- Approved according to EN 140401-801
- Lead (Pb)-free solder contacts
- Compliant to RoHS directive 2002/95/EC

APPLICATIONS

- Automotive
- Telecommunication
- Medical equipment
- Industrial equipment

METRIC SIZE

TECHNICAL SPECIFICATIONS					
DESCRIPTION	MCS 0402 AT	MCT 0603 AT	MCU 0805 AT	MCA 1206 AT	
Metric size	RR 1005M	RR 1608M	RR 2012M	RR 3216M	
Resistance range	47 Ω to 47 kΩ	47 Ω to 100 kΩ	47 Ω to 100 kΩ	47 Ω to 100 kΩ	
Resistance tolerance	± 1 %; ± 0.5 %				
Temperature coefficient	± 50 ppm/K; ± 25 ppm/K				
Rated dissipation P_{85} ⁽¹⁾	0.100 W	0.150 W	0.200 W	0.400 W	
Operating voltage, U_{max} . AC/DC	50 V	75 V	150 V	200 V	
Permissible film temperature ⁽¹⁾	175 °C				
Insulation voltage	1 min; U_{ins}	75 V	100 V	200 V	300 V
	Continuous	75 V	75 V	75 V	75 V

Note

⁽¹⁾ Please refer to APPLICATION INFORMATION below

APPLICATION INFORMATION

The power dissipation on the resistor generates a temperature rise against the local ambient, depending on the heat flow support of the printed-circuit board (thermal resistance). The rated dissipation applies only if the permitted film temperature is not exceeded. Furthermore, a high level of ambient temperature or of power dissipation may raise the temperature of the solder joint, hence special solder alloys or board materials may be required to maintain the reliability of the assembly.

These resistors do not feature a limited lifetime when operated within the permissible limits. However, resistance value drift increasing over operating time may result in exceeding a limit acceptable to the specific application, thereby establishing a functional lifetime. At the maximum permissible film temperature of 175 °C the useful lifetime is specified for 1000 h. The designer may estimate the performance of the particular resistor application or set certain load and temperature limits in order to maintain a desired stability.

MAXIMUM RESISTANCE CHANGE AT RATED DISSIPATION				
Operation mode		Standard	Power	Advanced Temperature
Rated dissipation		P_{70}	P_{70}	P_{85}
	MCS 0402 AT	0.063 W	0.100 W	0.100 W

MCA 1206 AT	1.40	1.50	1.90	4.40	1.50	1.15	1.75	3.80

Note

- The rated dissipation applies only if the permitted film temperature is not exceeded. Furthermore, a high level of ambient temperature or of power dissipation may raise the temperature of the solder joint, hence special solder alloys or board materials may be required to maintain the reliability of the assembly. Specified power rating above 125 °C requires dedicated heat-sink pads, which depend on board materials.

The given solder pad dimensions reflect the considerations for board design and assembly as outlined e.g. in standards IEC 61188-5-x, or in publication IPC-7351. They do not guarantee any supposed thermal properties, particularly as these are also strongly influenced by many other parameters.

Still, the given solder pad dimensions will be found adequate for most general applications, e.g. those referring to "standard operation mode". Please note however that applications for "power operation mode" or "advanced temperature mode" require special considerations for the design of solder pads and adjacent conductor areas.

DESCRIPTION

Production is strictly controlled and follows an extensive set of instructions established for reproducibility. A homogeneous film of special metal alloy is deposited on a high grade (Al₂O₃) ceramic substrate and conditioned to achieve the desired temperature coefficient. Specially designed inner contacts are deposited on both sides. A special laser is used to achieve the target value by smoothly cutting a meander groove in the resistive layer without damaging the ceramics. The resistor elements are covered by a unique protective coating designed for electrical, mechanical and climatic protection. The terminations receive a final pure tin on nickel plating.

The result of the determined production is verified by an extensive testing procedure and optical inspection performed on 100 % of the individual chip resistors. Only accepted products are laid directly into the paper tape in accordance with **IEC 60286-3** ⁽³⁾.

ASSEMBLY

The resistors are suitable for processing on automatic SMD assembly systems. They are suitable for automatic soldering using wave, reflow or vapour phase as shown in **IEC 61760-1** ⁽³⁾. The encapsulation is resistant to all cleaning solvents commonly used in the electronics industry, including alcohols, esters and aqueous solutions. The suitability of conformal coatings, if applied, shall be qualified by appropriate means to ensure the long-term stability of the whole system.

The resistors are RoHS compliant; the pure tin plating provides compatibility with lead (Pb)-free and lead-containing soldering processes. Solderability is specified for 2 years after production or requalification. The permitted storage time is 20 years. The immunity of the plating against tin whisker growth has been proven under extensive testing.

All products comply with the **GADSL** ⁽¹⁾ and the **CEFIC-EECA-EICTA** ⁽²⁾ list of legal restrictions on hazardous substances. This includes full compliance with the following directives:

- 2000/53/EC End of Vehicle life Directive (ELV) and Annex II (ELV II)
- 2002/95/EC Restriction of the use of Hazardous Substances directive (RoHS)
- 2002/96/EC Waste Electrical and Electronic Equipment Directive (WEEE)

Notes

⁽¹⁾ Global Automotive Declarable Substance List, see www.gadsl.org

⁽²⁾ CEFIC (European Chemical Industry Council), EECA (European Electronic Component Manufacturers Association), EICTA (European trade organisation representing the information and communications technology and consumer electronics), see www.eicta.org/index.php?id=995
→ issues → environment policy → chemicals → chemicals for electronics

⁽³⁾ The quoted IEC standards are also released as EN standards with the same number and identical contents

APPROVALS

The resistors are approved within the IECQ-CECC Quality Assessment System for Electronic Components to the detail specification **EN 140401-801** which refers to **EN 60115-1**, **EN 140400** and the variety of environmental test procedures of the **IEC 60068** ⁽³⁾ series. The detail specification refers to the climatic category 55/125/56, which relates to the “standard operation mode” of this datasheet.

Conformity is attested by the use of the CECC Logo (Ⓔ) as the Mark of Conformity on the package label. For MCS 0402 AT and zero ohm jumpers the certification according to DIN EN 140401-801:2008-05 is pending.

Vishay BEYSCHLAG has achieved “**Approval of Manufacturer**” in accordance with **IEC QC 001002-3, clause 2**. The release certificate for “**Technology Approval Schedule**” in accordance with **CECC 240001** based on **IEC QC 001002-3, clause 6** is granted for the Vishay BEYSCHLAG manufacturing process.

The resistors are qualified according to AEC-Q200.

RELATED PRODUCTS

This product family of thin film flat chip resistors is completed by **Zero Ohm Jumpers**.

For more information about products with better TCR and tighter tolerance please refer to the **precision** datasheet document no. **28785**.

Chip resistor arrays may be used in sensing applications or precision amplifiers where close matching between multiple resistors is necessary. Please refer to the ACAS AT - Precision datasheet document no. **28770**.

FUNCTIONAL PERFORMANCE

For permissible resistance change please refer to table MAXIMUM RESISTANCE CHANGE AT RATED POWER, above

Derating

Maximum pulse load, single pulse; for permissible resistance change equivalent to 8000 h operation

Single Pulse

Maximum pulse load, continuous pulses; for permissible resistance change equivalent to 8000 h operation

Continuous Pulse

Maximum pulse voltage, single and continuous pulses; for permissible resistance change equivalent to 8000 h operation

Pulse Voltage

Pulse load rating in accordance with EN 60115-1 clause 4.27; 1.2 μ s/50 μ s; 5 pulses at 12 s interval; for permissible resistance change 0.5 %

1.2/50 Pulse

Pulse load rating in accordance with EN 60115-1 clause 4.27; 10 μ s/700 μ s; 10 pulses at 1 min intervals; for permissible resistance change 0.5 %

TESTS AND REQUIREMENTS

All tests are carried out in accordance with the following specifications:

- EN 60115-1, generic specification
- EN 140400, sectional specification
- EN 140401-801, detail specification

The components are approved in accordance with the IECQ-CECC-system, where applicable. The following table contains only the most important tests. For the full test schedule refer to the documents listed above. The testing also covers most of the requirements specified by EIA/IS-703 and JIS-C-5202.

The tests are carried out in accordance with IEC 60068 and under standard atmospheric conditions in accordance with IEC 60068-1, 5.3. Climatic category LCT/UCT/56 (rated temperature range: Lower category temperature, upper

category temperature; damp heat, long term, 56 days) is valid (LCT = - 55 °C/UCT = 155 °C).

Unless otherwise specified the following values apply:

Temperature: 15 °C to 35 °C

Relative humidity: 45 % to 75 %

Air pressure: 86 kPa to 106 kPa (860 mbar to 1060 mbar).

The components are mounted for testing on boards in accordance with EN 140400, 2.3.3 unless otherwise specified.

The requirements stated in the Test Procedures and Requirements table are based on the required tests and permitted limits of EN 140401-801. However, some additional tests and a number of improvements against those minimum requirements have been included.
