DESCRIPTION

The Hynix H57V2622GMR Synchronous DRAM (Dual Die) ideally suited for the consumer memory applications which requires large memory density and high bandwidth uses Hynix's 128Mb SDR monolithic die and has similar functionality.

Synchronous DRAM is a type of DRAM which operates in synchronization with input clock. The Hynix Synchronous DRAM latch each control signal at the rising edge of a basic input clock (CLK) and input/output data in synchronization with the input clock (CLK). The address lines are multiplexed with the Data Input/ Output signals on a multiplexed x32 Input/ Output bus. All the commands are latched in synchronization with the rising edge of CLK.

The Synchronous DRAM provides for programmable read or write Burst length of Programmable burst lengths: 1, 2, 4, 8 locations or full page. An AUTO PRECHARGE function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst access. The Synchronous DRAM uses an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the 2n rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one bank while accessing one of the other three banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

Read and write accesses to the Hynix Synchronous DRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and the row to be accessed. The address bits registered coincident with the READ or WRITE command are used to select the bank and the starting column location for the burst access.

A burst of Read or Write cycles in progress can be terminated by a burst terminate command or can be interrupted and replaced by a new burst Read or Write command on any cycle (This pipelined design is not restricted by a 2N rule).

All inputs are LVTTTL compatible. Devices will have a VDD and VDDQ supply of 3.3V (nominal).

256Mb Synchronous DRAM(8M x 32) FEATURES

- Standard SDRAM Protocol
- Uses 2pcs of 128Mb Monolithic Die
- Power Supply Voltage : VDD = 3.3V, VDDQ = 3.3V
- All device pins are compatible with LVTTTL interface
- 4096 Refresh cycles / 64ms
- Programmable CAS latency of 2 or 3
- Programmable Burst Length and Burst Type
- Operating Temp.
 - Commercial Temp. : 0°C ~ 70°C, Industrial Temp. : -40°C ~ 85°C
- [This product is in compliance with the directive pertaining of RoHS.](#)

Note :

1. H: Logic High, L: Logic Low, X: Don't care, BA: Bank Address, AP: Auto Precharge.
2. All entries assume that CKE was active during the preceding clock cycle.
3. If both banks are idle and CKE is inactive, then in power down cycle
4. Illegal to bank in specified states. Function may be legal in the bank indicated by Bank Address, depending on the state of that bank.
5. If both banks are idle and CKE is inactive, then Self Refresh mode.
6. Illegal if tRCD is not satisfied.
7. Illegal if tRAS is not satisfied.
8. Must satisfy burst interrupt condition.
9. Must satisfy bus contention, bus turn around, and/or write recovery requirements.
10. Must mask preceding data which don't satisfy tDPL.
11. Illegal if tRRD is not satisfied
12. Illegal for single bank, but legal for other banks in multi-bank devices.
13. Illegal for all banks.

CKE Enable(CKE) Truth TABLE (Sheet 2 of 2)

| Current State | CKE | | Command | | | | | | Action | Notes |
|-----------------------------------|----------------|---------------|------------------------|-------------------------|-------------------------|------------------------|----------|------|--|-------|
| | Previous Cycle | Current Cycle | $\overline{\text{CS}}$ | $\overline{\text{RAS}}$ | $\overline{\text{CAS}}$ | $\overline{\text{WE}}$ | BA0, BA1 | ADDR | | |
| Any State other than listed above | H | H | X | X | X | X | X | X | Refer to operations of the Current State Truth Table | |

| | L | L | X | X | X | X | X | X | Maintain Clock Suspend | |

Note :

1. For the given current state CKE must be low in the previous cycle.
2. When CKE has a low to high transition, the clock and other inputs are re-enabled asynchronously. When exiting power down mode, a NOP (or Device Deselect) command is required on the first positive edge of clock after CKE goes high.
3. The address inputs depend on the command that is issued.
4. The Precharge Power Down mode, the Self Refresh mode, and the Mode Register Set can only be entered from the all banks idle state.
5. When CKE has a low to high transition, the clock and other inputs are re-enabled asynchronously. When exiting deep power down mode, a NOP (or Device Deselect) command is required on the first positive edge of clock after CKE goes high and is maintained for a minimum 200usec.
