

STGIPS14K60

IGBT intelligent power module (IPM)
12 A, 600 V, DBC isolated, SDIP-25L molded

Features

- 12 A, 600 V 3-phase IGBT inverter bridge including control ICs for gate driving and free-wheeling diodes
- 3.3 V, 5 V, 15 V CMOS/TTL inputs comparators with hysteresis and pull down / pull up resistors
- Internal bootstrap diode
- Interlocking function
- $V_{CE(sat)}$ negative temperature coefficient
- Short-circuit rugged IGBTs
- Undervoltage lockout
- Smart shutdown function
- Comparator for fault protection against over temperature and overcurrent
- DBC fully isolated package
- Isolation rating of 2500 Vrms/min

technology. Please refer to dedicated technical note TN0107 for mounting instructions.

Applications

- 3-phase inverters for motor drives
- Home appliances, such as washing machines, refrigerators, air conditioners

Description

The STGIPS14K60 intelligent power module provides a compact, high performance AC motor drive for a simple and rugged design. It mainly targets low power inverters for applications such as home appliances and air conditioners. It combines ST proprietary control ICs with the most advanced short circuit rugged IGBT system

4 Smart shutdown function

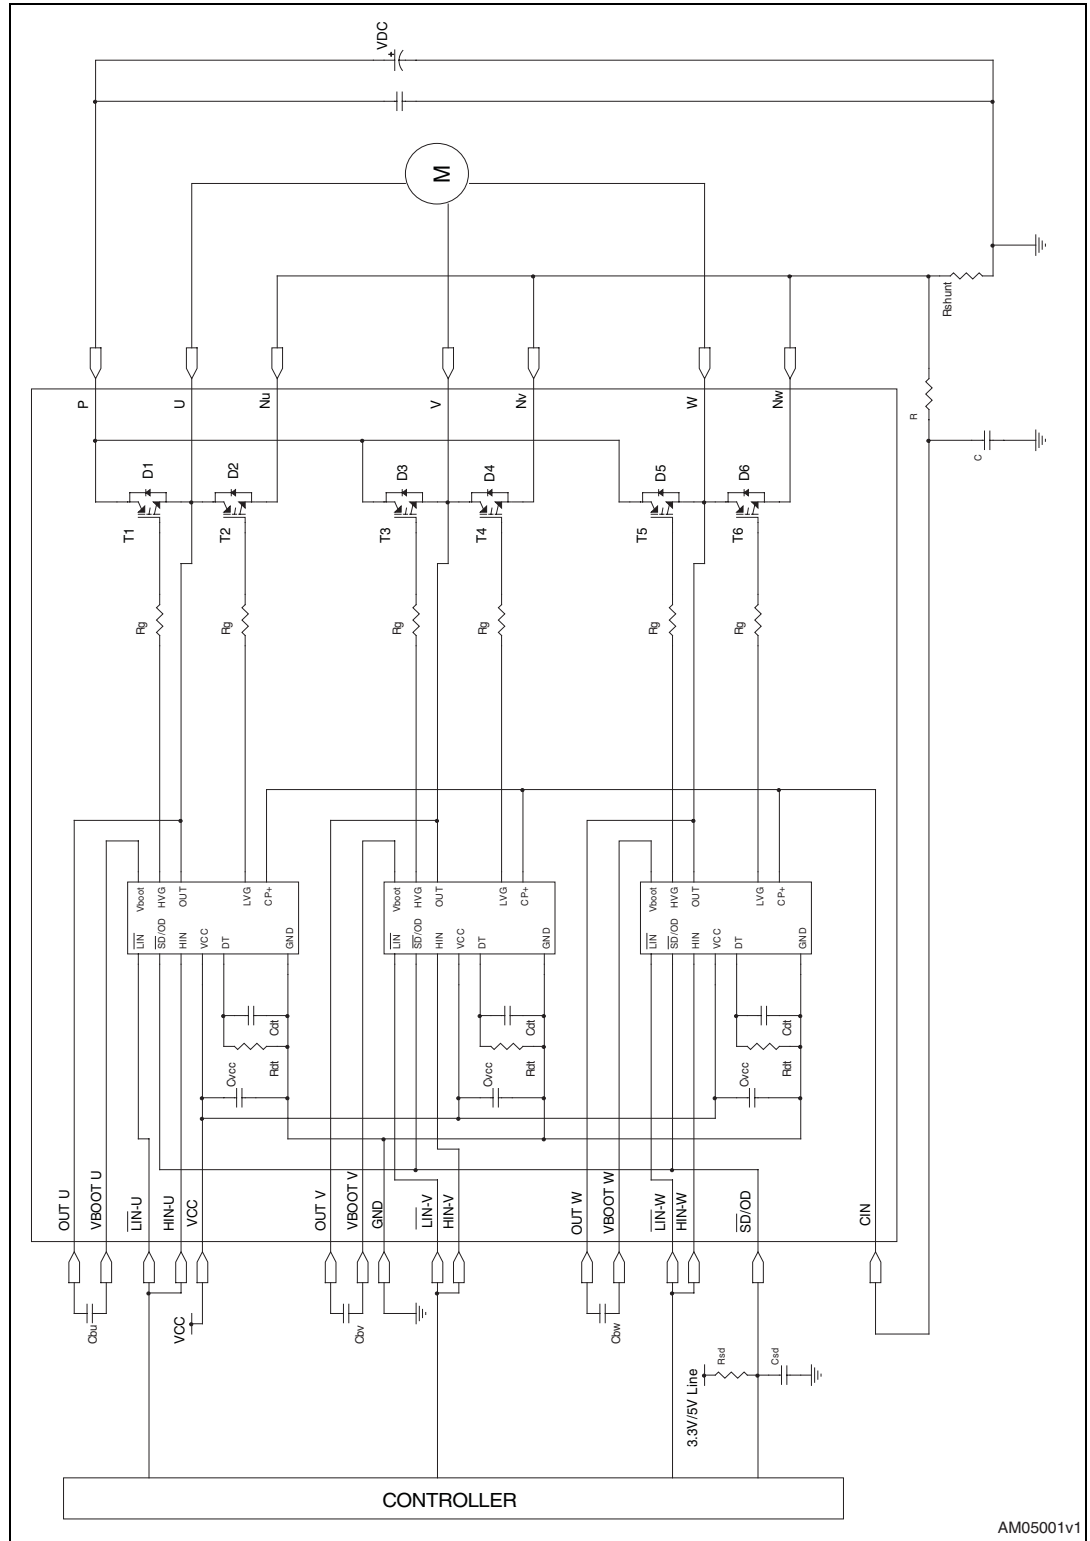

The STGIPS14K60 integrates a comparator for fault sensing purposes. The comparator non-inverting input (CIN) can be connected to an external shunt resistor in order to implement a simple over-current protection function. When the comparator triggers, the device is set in shutdown state and both its outputs are set to low level leading the half-bridge in tri-state. In the common overcurrent protection architectures the comparator output is usually connected to the shutdown input through a RC network, in order to provide a mono-stable circuit, which implements a protection time that follows the fault condition. Our smart shutdown architecture allows to immediately turn-off the output gate driver in case of overcurrent, the fault signal has a preferential path which directly switches off the outputs. The time delay between the fault and the outputs turn-off is no more dependent on the RC values of the external network connected to the shutdown pin. At the same time the internal logic turns on the open drain output and holds it on until the shutdown voltage goes below the logic input lower threshold. Finally the smart shutdown function provides the possibility to increase the real disable time without increasing the constant time of the external RC network.

5.1 Recommendations

- To prevent the input signals oscillation, the wiring of each input should be as short as possible.
- By integrating an application specific type HVIC inside the module, direct coupling to MCU terminals without any opto-coupler is possible.
- Each capacitor should be located as nearby the pins of IPM as possible.
- Low inductance shunt resistors should be used for phase leg current sensing.
- Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
- The \overline{SD}/OD signal should be pulled up to 5 V / 3.3 V with an external resistor (see [Section 4: Smart shutdown function](#) for detailed info).
