NOTE :

1. The value of $R\theta_{ja}$ is measured with the device mounted on 1in² FR-4 board of 2oz. Copper, in still air environment with $T_a=25^\circ C$. The value in any given applications depends on the user's specific board design, The current rating is based on the $t \leq 10s$ thermal resistance rating.
2. Repetitive rating, pulse width limited by junction temperature.
3. The $R\theta_{ja}$ is the sum of the thermal impedance from junction to lead $R\theta_{jl}$ and lead to ambient.
4. The static characteristics in Figures 1 to 6 are obtained using 80 μs pulses, duty cycle 0.5%max.
5. These tests are performed with the device mounted on 1in² FR-4 board with 2oz. Copper, in a still air environment with $T_a=25^\circ C$. The SOA curve provides a single pulse rating.
