- 1. NC = No Connection
- For single supply operation VEE is internally generated and must remain isolated from external power supplies.
 Generated noise is typical of switching DC-DC converters.
- Connections and external components shown in functional schematic are required. 0.1μF Capacitors need to be located near pins 32 & 33.
- The exposed pad centered on the package bottom must be connected to RF and DC ground. (For PQFN Packages)

During turn-on, the device requires an initial start up current (Icc) specified as "Turn-on Current". Once operational, Icc will drop to the specified levels. This is not applicable to dual supply operation.

^{6.} The DC-DC converter is guaranteed to start in 100 μs as long as the power supplies have the maximum turn-on current available for start-up.

^{7.} For single supply operation

- Exceeding any one or combination of these limits may cause permanent damage to this device.
- M/A-COM does not recommend sustained operation near these survivability limits.
- 11. When the RF input is applied to the terminated port, the absolute maximum power is +30 dBm.
- Standard CMOS TTL interface, latch-up will occur if logic signal is applied prior to power supply.
