Note 1 : In order to satisfy the quality of B/L, no matter what inverter is used, the output lamp current must be between Min. and Max. to avoid the abnormal display image caused by B/L.

Note 2 : The waveform of lamp driving voltage should be as close to a perfect sine wave as possible.

Note 3 : The "Max of starting voltage" means the minimum voltage of inverter turns on the CCFL and it should be applied to the lamp for more than 1 second to start up. Otherwise the lamp may not be turned on.

Note 2: Gate on voltage,  $V_{GG} = 15.4V$ .

Note 3: Select up or down shift (**see Table 1**)

Note 4: Gate driver shift clock

Note 5: When OE is connected to high "1", the driver outputs are disabled (Gate output= $V_{EE}$ ). Under this condition, the operation of registers will not be affected.

Note 6: Select left or right shift (**see Table 2**)

Note 7: Latch the polarity of outputs and switch the new data to outputs. At the rising edge (LD), latch the "POL" signal to control the polarity of the outputs.

Note 8: Control whether the Data RO~G5 are inverted or not. (PVI suggests connecting to GND) When "REV=1" these data will be inverted. EX: "00" to "3F", "07" to "38", "15" to "2A"

Note 9: Polarity selector for dot-inversion control. Available at the rising edge of LD. When POL=1: Even outputs range from V1~V7, and Odd outputs range from V8~V14, and Odd outputs range from V1~V7.

Note 10: VDD2 = 7.7V (Typical Application Circuit (when V1=7.7V))
