## **High Voltage EL Lamp Driver**

#### **Features**

- ▶ 1.8V to 6.5V operating supply voltage
- DC to AC conversion
- Separately adjustable lamp and converter frequency
- Output voltage regulation
- ► Enable/disable function
- Patented output timing for high efficiency
- <100nA shutdown current</p>
- Split supply capability
- LCD backlighting

#### **Applications**

- Portable Transceivers
- Remote Control Units
- Calculators
- PDAs
- Global Positioning Systems (GPS)

#### **General Description**

The Supertex HV833 is a high voltage driver designed for driving EL lamps of up to 35nF (10-12in²). The input supply voltage range is from 1.8V to 6.5V. The device uses a single inductor and a minimum number of passive components. The nominal regulated output voltage that is applied to the EL lamp is  $\pm 90$ V. The chip can be enabled/disabled by connecting a resistor between the  $R_{\text{SW-Osc}}$  pin and the  $V_{\text{DD}}/\text{GND}$  pins.

The HV833 has two internal oscillators, a switching MOSFET, and a high voltage EL lamp driver. The frequency for the switching MOSFET is set by an external resistor connected between the  $R_{\text{SW-Osc}}$  pin and the  $V_{\text{DD}}$  supply pin. The EL lamp driver frequency is set by an external resistor connected between the  $R_{\text{EL-Osc}}$  pin and the  $V_{\text{DD}}$  pin. An external inductor is connected between the  $L_{\text{X}}$  pin and  $V_{\text{DD}}$  or  $V_{\text{IN}}$  pin. A 0.003-0.1µF capacitor is connected between the  $C_{\text{S}}$  pin and the GND pin. The EL lamp is connected between the  $V_{\text{A}}$  pin and the  $V_{\text{B}}$  pin.

The switching MOSFET charges the external inductor and discharges it into the capacitor at  $C_s$ . The voltage at  $C_s$  will start to increase. Once the voltage at  $C_s$  reaches a nominal value of 90V, the switching MOSFET is turned OFF to conserve power. The outputs  $V_A$  and  $V_B$  are configured as an H bridge and are switching in opposite states to achieve 180V peak-to-peak across the EL lamp.

## **Typical Application Circuit**

## **Ordering Information**

| Device | Package Options     |           |  |  |  |  |  |
|--------|---------------------|-----------|--|--|--|--|--|
| Device | MSOP-8 <sup>1</sup> |           |  |  |  |  |  |
| HV833  | HV833MG             | HV833MG-G |  |  |  |  |  |

<sup>-</sup>G indicates package is RoHS compliant ('Green')

# R

## **Absolute Maximum Ratings**

| Parameter                       | Value           |
|---------------------------------|-----------------|
| Supply voltage V <sub>DD</sub>  | -0.5V to 7.5V   |
| Output voltage, V <sub>cs</sub> | -0.5V to 125V   |
| Operating Temperature           | -40°C to +85°C  |
| Storage Temperature             | -65°C to +150°C |
| MSOP-8 Power Dissipation        | 300mW           |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## **Pin Configuration**

## **Recommended Operating Conditions**

| Symbol          | Parameter                               | Min | Тур | Max  | Units | Conditions |
|-----------------|---|-----|-----|------|-------|------------|
| $V_{DD}$        | Supply voltage                          | 1.8 | -   | 6.5  | V     |            |
| f <sub>EL</sub> | V <sub>A-B</sub> output drive frequency | 60  | -   | 1000 | Hz    |            |

#### **Enable/Disable Configuration**

The HV833 can be easily enabled and disabled via a logic control signal on the  $R_{\text{SW}}$  and  $R_{\text{EL}}$  resistors as shown in the Typical Application Circuit on the front page. The control signal can be from a microprocessor.  $R_{\text{SW}}$  and  $R_{\text{EL}}$  are typically

very high values. Therefore, only 10's of microamperes will be drawn from the logic signal when it is at a logic high (enable) state. When the microprocessor signal is high the device is enabled and when the signal is low, it is disabled.

#### **Enable/Disable Table**

| Enable Signal   | HV833   |
|-----------------|---------|
| V <sub>DD</sub> | Enable  |
| 0V              | Disable |

## Split Supply Configuration for Battery Voltages of Higher than 6.5V

The Typical Application Circuit on the first page can also be used with high battery voltages such as 12V as long as the input voltage,  $V_{\rm DD}$ , to the HV833 device is within its specifications of 1.8V to 6.5V. Split supply configuration is shown on Fig. 2.

#### **External Component Description**

| External Component       | Selection Guide Line  |
|--------------------------|---|
| Diode                    | Fast reverse recovery diode, 100V 1N4148 or equivalent.   |
| C <sub>s</sub> Capacitor | $0.003\mu F$ to $0.1\mu F$ , $100V$ capacitor to GND is used to store the energy transferred from the inductor.   |
| R <sub>EL-Osc</sub>      | The EL lamp frequency is controlled via an external $R_{EL}$ resistor connected between $R_{EL-Osc}$ and $V_{DD}$ pins of the device. The lamp frequency increases as $R_{EL}$ decreases. As the EL lamp frequency increases, the amount of current drawn from the battery will increase and the output voltage $V_{CS}$ will decrease. The color of the EL lamp is dependent upon its frequency.   |
| R <sub>sw-Osc</sub>      | The switching frequency of the converter is controlled via an external resistor, $R_{\text{sw}}$ between $R_{\text{sw-Osc}}$ and $V_{\text{DD}}$ pins of the device. The switching frequency increases as $R_{\text{sw}}$ decreases. With a given inductor, as the switching frequency increases, the amount of current drawn from the battery will decrease and the output voltage, $V_{\text{cs}}$ , will also decrease.  |
| L <sub>x</sub> Inductor  | The inductor $L_{\chi}$ is used to boost the low input voltage by inductive flyback. When the internal switch is on, the inductor is being charged. When the internal switch is off, the charge stored in the inductor will be transferred to the high voltage capacitor $C_{g}$ . The energy stored in the capacitor is connected to the internal H-bridge, and therefore to the EL lamp. In general, smaller value inductors, which can handle more current, are more suitable to drive larger size lamps. As the inductor value decreases, the switching frequency of the inductor (controlled by $R_{g}$ ) should be increased to avoid saturation.  A 220µH Murata (LQH43MN221) inductor with 5.4 $\Omega$ series DC resistance is typically |
|                          | recommended. For inductors with the same inductance value but with lower series DC resistance, a lower R <sub>sw</sub> value is needed to prevent high current draw and inductor saturation.  |
| Lamp                     | As the EL lamp size increases, more current will be drawn from the battery to maintain high voltage across the EL lamp. The input power, $(V_{\rm IN} \times I_{\rm IN})$ , will also increase. If the input power is greater than the power dissipation of the package (300mW), an external resistor in series with one side of the lamp is recommended to help reduce the package power dissipation.  |
