

### 1. INTRODUCTION

The ST7626 is a driver & controller LSI for 65K color graphic dot-matrix liquid crystal display systems. It generates 294 Segment and 68 Common driver circuits. This chip is connected directly to a microprocessor, accepts Serial Peripheral Interface (SPI) or 8-bit/16-bit parallel display data and stores in an on-chip display data RAM. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

### 2. FEATURES

#### Driver Output Circuits

- ◆ 294 Segment Outputs / 68 Common Outputs

#### Applicable Duty Ratios

- ◆ Various Partial Display
- ◆ Partial Window Moving & Data Scrolling

#### Gray-Scale Display

- ◆ 4FRC & 31 PWM function circuit to display
- ◆ 64 gray-scale display.

#### On-chip Display Data RAM

- ◆ Capacity: 98 x 68 x 16 =106,624 bits
- ◆ 4K colors (RGB)=(444) mode
- ◆ 65K colors (RGB)=(565) mode
- ◆ Truncated 262K colors (RGB)=(666) mode
- ◆ Truncated 16M colors (RGB)=(888) mode

#### Microprocessor Interface

- ◆ 8/16-bit parallel bi-directional interface with 6800-series or 8080-series
- ◆ 4-line serial interface (4-line-SIF)
- ◆ 3-line serial interface (3-line-SIF)

#### On-chip Low Power Analog Circuit

- ◆ On-chip Oscillator Circuit

- ◆ On-chip Voltage Converter (x2, x3, x4, x5) with internal booster capacitors.
- ◆ Extremely Few Outsider Component. (Minimum required outsider components: One Capacitor).
- ◆ On-chip Voltage Regulator (Temperature gradient = -0.065%/°C)
- ◆ On-chip Electronic Contrast Control Function (406 steps)
- ◆ Voltage Follower (LCD bias: 1/5 to 1/12)

#### Operating Voltage Range

- ◆ Supply Digital Voltage (VDD, VDD1): 1.8 to 3.3V
- ◆ Supply Analog Voltage (VDD2, VDD3, VDD4, VDD5): 2.4 to 3.3V
- ◆ LCD Driving Voltage (VOP = V0 - VSS): 3.76V to 18V
- ◆ The suggested value of V0 is under 11 V with bias =1/9.

#### LCD Driving Voltage (EEPROM)

- ◆ Contrast Adjustment Value is stored in the Built-In EEPROM for better display quality.

#### LCM Performance Adjustment (EEPROM)

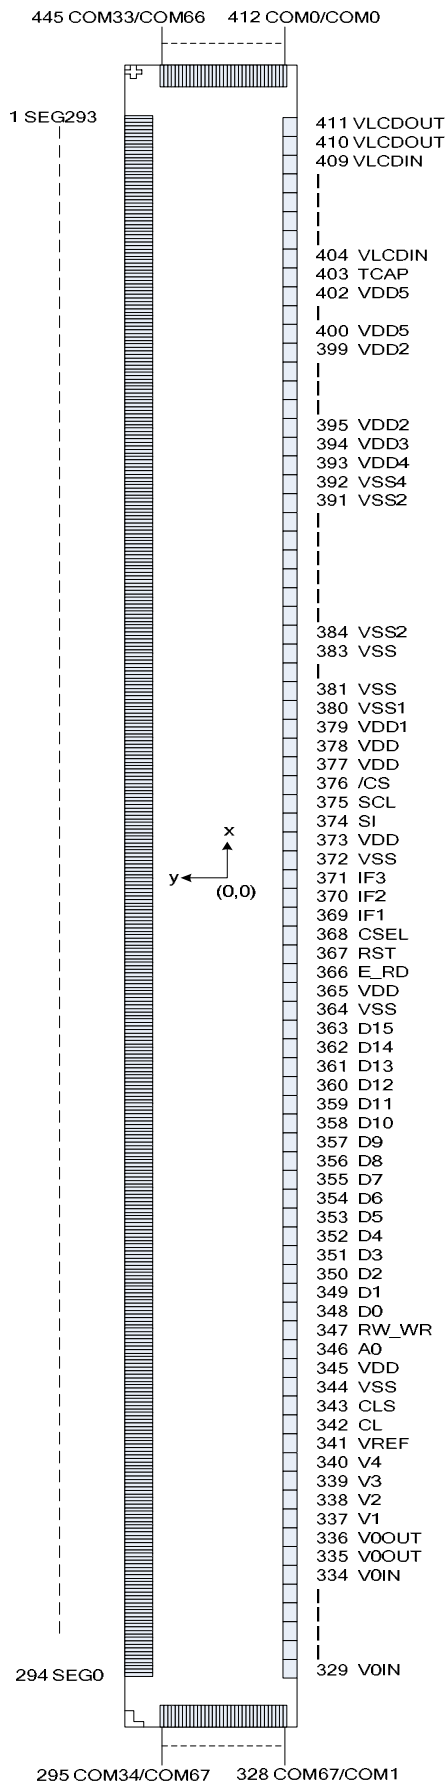

- ◆ Adjustment Value for best Display Performance is stored in the Built-In EEPROM.

#### Package Type

- ◆ Application for COG

<p><b>ST7626</b></p>	<p><b>6800 , 8080 ,4-Line , 3-Line interface</b></p>

5. BLOCK DIAGRAM

## 6. PIN DESCRIPTION

### 6.1 POWER SUPPLY

Name	I/O	Description
VDD	Supply	Power supply for logic circuit
VDD1	Supply	Power supply for OSC circuit
VDD2	Supply	Power supply for Booster Circuit
VDD3	Supply	Power supply for LCD.
VDD4	Supply	Power supply for LCD.
VDD5	Supply	Power supply for LCD.
VSS	Supply	Ground for logic circuit. Ground system should be connected together.
VSS1	Supply	Ground for OSC circuit. Ground system should be connected together.
VSS2	Supply	Ground for Booster Circuit. Ground system should be connected together.
VSS4	Supply	Ground for LCD. Ground system should be connected together.

### 6.2 LCD Power Supply Pins

VLCD <sub>OUT</sub>	O	If the internal voltage generator is used, the VLCD <sub>IN</sub> & VLCD <sub>OUT</sub> must be connected together. If an external supply is used, this pin must be left open.										
VLCD <sub>IN</sub>	I	An external LCD supply voltage can be supplied using the VLCD <sub>IN</sub> pin. In this case, VLCD <sub>OUT</sub> has to be left open, and the internal voltage generator has to be programmed to zero. (SET register VC=0)										
V0 <sub>IN</sub> V0 <sub>OUT</sub> V1 V2 V3 V4	I/O	<p>LCD driver supply voltages</p> <p>V0<sub>in</sub> &amp; V0<sub>out</sub> should be connected together.</p> <p>Voltages should have the following relationship;</p> <p>V0 ( V0<sub>in</sub> )    V1    V2    V3    V4    VSS.</p> <p>When the internal power circuit is active, these voltages are generated as following table according to the state of LCD bias.</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>LCD bias</th> <th>V1</th> <th>V2</th> <th>V3</th> <th>V4</th> </tr> </thead> <tbody> <tr> <td>1/N bias</td> <td><math>(N-1) / N \times V0</math></td> <td><math>(N-2) / N \times V0</math></td> <td><math>(2/N) \times V0</math></td> <td><math>(1/N) \times V0</math></td> </tr> </tbody> </table> <p>NOTE: N = 5 to 12</p>	LCD bias	V1	V2	V3	V4	1/N bias	$(N-1) / N \times V0$	$(N-2) / N \times V0$	$(2/N) \times V0$	$(1/N) \times V0$
LCD bias	V1	V2	V3	V4								
1/N bias	$(N-1) / N \times V0$	$(N-2) / N \times V0$	$(2/N) \times V0$	$(1/N) \times V0$								

### 6.3 SYSTEM CONTROL

Name	I/O	Description
CLS	I	When using internal clock oscillator, connect CLS to VDD. When using external clock oscillator, connect CLS to VSS.
CL	I/O	When using internal clock oscillator, it's oscillator output. When using external clock oscillator, it's clock input.
CSEL	I	Select Common output direction. CSEL="L", COM0~COM33 is in one side, COM34~COM67 is in the opposite side. CSEL="H", COM2n(even number) is in the one side, COM2n+1 (odd number) is in the opposite side.
TCAP	I/O	Test pin. Left it opens.
VREF	O	Reference voltage output for monitor only. Left it opened. Do NOT connect this PAD.

## 6.4 MICROPROCESSOR INTERFACE

Name	I/O	Description																												
RST	I	Reset input pin. When RESETB is "L", initialization is executed.																												
IF[3:1]	I	<p>Parallel / Serial data input select input</p> <table border="1"> <thead> <tr> <th>IF1</th> <th>IF2</th> <th>IF3</th> <th>MPU interface type</th> </tr> </thead> <tbody> <tr> <td>H</td> <td>H</td> <td>H</td> <td>80 series 16-bit parallel</td> </tr> <tr> <td>H</td> <td>H</td> <td>L</td> <td>80 series 8-bit parallel</td> </tr> <tr> <td>H</td> <td>L</td> <td>L</td> <td>68 series 16-bit parallel</td> </tr> <tr> <td>L</td> <td>H</td> <td>H</td> <td>68 series 8-bit parallel</td> </tr> <tr> <td>L</td> <td>L</td> <td>H</td> <td>9-bit serial (3 line)</td> </tr> <tr> <td>L</td> <td>L</td> <td>L</td> <td>8-bit serial (4 line)</td> </tr> </tbody> </table>	IF1	IF2	IF3	MPU interface type	H	H	H	80 series 16-bit parallel	H	H	L	80 series 8-bit parallel	H	L	L	68 series 16-bit parallel	L	H	H	68 series 8-bit parallel	L	L	H	9-bit serial (3 line)	L	L	L	8-bit serial (4 line)
IF1	IF2	IF3	MPU interface type																											
H	H	H	80 series 16-bit parallel																											
H	H	L	80 series 8-bit parallel																											
H	L	L	68 series 16-bit parallel																											
L	H	H	68 series 8-bit parallel																											
L	L	H	9-bit serial (3 line)																											
L	L	L	8-bit serial (4 line)																											
/CS	I	<p>Chip select input pins</p> <p>Data / Instruction I/O is enabled only when /CS is "L". When chip select is non-active, D0 to D15 become high impedance.</p>																												
A0	I	<p>Register select input pin</p> <p>A0 = "H": D0 to D15 or SI are display data</p> <p>A0 = "L": D0 to D15 or SI are control data</p> <p>In 3-line interface not let it floating, connect it to "H" level.</p>																												
RW_WR	I	<p>Read / Write execution control pin</p> <table border="1"> <thead> <tr> <th>MPU type</th> <th>RW_WR</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>6800-series</td> <td>RW</td> <td> <p>Read / Write control input pin</p> <p>RW = "H" : read</p> <p>RW = "L" : write</p> </td> </tr> <tr> <td>8080-series</td> <td>/WR</td> <td> <p>Write enable clock input pin</p> <p>The data on D0 to D15 are latched at the rising edge of the /WR signal.</p> </td> </tr> </tbody> </table> <p>When in the serial interface, connect it to "H" level.</p>	MPU type	RW_WR	Description	6800-series	RW	<p>Read / Write control input pin</p> <p>RW = "H" : read</p> <p>RW = "L" : write</p>	8080-series	/WR	<p>Write enable clock input pin</p> <p>The data on D0 to D15 are latched at the rising edge of the /WR signal.</p>																			
MPU type	RW_WR	Description																												
6800-series	RW	<p>Read / Write control input pin</p> <p>RW = "H" : read</p> <p>RW = "L" : write</p>																												
8080-series	/WR	<p>Write enable clock input pin</p> <p>The data on D0 to D15 are latched at the rising edge of the /WR signal.</p>

## ST7626

---

### ST7626 I/O PIN ITO Resister Limitation

Pin Name	ITO Resister
TCAP, CL	Floating
IF[3:1],CLS,CSEL	No Limitation
VDD, VDD1~VDD5, VSS,VSS1,VSS2,VSS4,VLCD <sub>IN</sub> , VLCD <sub>OUT</sub>	<100Ω
V0 <sub>IN</sub> , V0 <sub>OUT</sub> , V1, V2, V3, V4	<100Ω
A0, E_RD, RW_WR, /CS, D0 ...D15, SCL, SI	<1KΩ
RST	<10KΩ

**NOTE:**

***Make sure that the ITO resistance of COM0 ~ COM67 is equal, and so is it of SEG0 ~ SEG293.***

***Vref could not connect to external. Therefore, no ITO resistance value listed.***

## 7. FUNCTIONAL DESCRIPTION

### 7.1 MICROPROCESSOR INTERFACE

#### Chip Select Input

/CS pin is for chip selection. The ST7626 can function with an MPU when /CS is "L". In case of serial interface, the internal shift register and the counter are reset.

#### 7.1.1 Selecting Parallel / Serial Interface

ST7626 has six types of interface with an MPU, which are two serial and four parallel interfaces. This parallel or serial interface is determined by IF pin as shown in table 7.1.1.

**Table 7.1.1 Parallel / Serial Interface Mode**

I/F Mode			I/F Description	Pin Assignment							
IF1	IF2	IF3		/CS	A0	E_RD	RW_WR	D15 to D8	D7 to D0	SI	SCL
H	H	H	80 serial 16-bit parallel	/CS	A0	/RD	/WR	D15 ~ D8	D7 ~ D0	--	--
H	H	L	80 serial 8-bit parallel	/CS	A0	/RD	/WR	--	D7 ~ D0	--	--
H	L	L	68 serial 16-bit parallel	/CS	A0	E	R/W	D15 ~ D8	D7 ~ D0	--	--
L	H	H	68 serial 8-bit parallel	/CS	A0	E	R/W	--	D7 ~ D0	--	--
L	L	L	8-bit SPI mode (4 line)	/CS	A0	--	--	--	--	SI	SCL
L	L	H	9-bit SPI mode (3 line)	/CS	--	--	--	--	--	SI	SCL

NOTE: When these pins are set to any other combination, A0, E\_RD and RW\_WR inputs are disabled and D0 to D15 are to be high impedance.

#### 7.1.2 8-bit or 16-bit Parallel Interface

The ST7626 identifies the type of the data bus signals according to the combination of A0, /RD (E) and /WR (W/R) signals, as shown in table 7.1.2.

**Table 7.1.2 Parallel Data Transfer**

Common	6800-series		8080-series		Description
	A0	R/W	E	/RD	
H	H	H	L	H	Display data read out
H	L	H	H	L	Display data write
L	H	H	L	H	Register status read
L	L	H	H	L	Writes to internal register (instruction)

Figure 7.1.2 Parallel Data Transfer Example Chart

**Relation between Data Bus and Gradation Data**

ST7626 offers 4096 color display, 65K color display, truncated 262K color display, and truncated 16M color display. When using 4096, 65K, 262K, and 16M color display; you can specify color for each of R, G, B using the palette function. Use the command for switching between these modes.

**(1) 4096-color display**

(1-1) Type A 4096 color display

**1. 8-bit mode**

D7, D6, D5, D4, D3, D2, D1, D0: **RRRRGGGG** 1st write

D7, D6, D5, D4, D3, D2, D1, D0: **BBBBRRRR** 2nd write

D7, D6, D5, D4, D3, D2, D1, D0: **GGGGBBBB** 3rd write

2 pixels of data are read after the third write operation as shown, and it is written in the display RAM.

## 2. 16-bit mode

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRGGGGBBBBXXXX

Data is acquired through signal write operation and then written to the display RAM.

“XXXX” are dummy bits, and they are ignored for display.

### (1-2) Type B 4096 color display

#### 1. 8-bit mode

D7, D6, D5, D4, D3, D2, D1, D0: XXXXRRRR 1st write

D7, D6, D5, D4, D3, D2, D1, D0: GGGGBBBB 2nd write

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

#### 2. 16-bit mode

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: XXXXRRRRGGGGBBBB

A single pixel of data is read and written in the display RAM in a single write operation.

“XXXX” are dummy bits, and they are ignored for display.

### (2) 65K color input mode

#### 1. 8-bit mode

D7, D6, D5, D4, D3, D2, D1, D0: RRRRRGGG 1st write

D7, D6, D5, D4, D3, D2, D1, D0: GGGBBBBB 2nd write

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

#### 2. 16-bit mode

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRRGGGGGBBBB (16 bits)

Data is acquired through signal write operation and then written to the display RAM.

### (3) Truncated 262K color input mode

#### 1. 8-bit mode

D7, D6, D5, D4, D3, D2, D1, D0: RRRRRRXX 1st write

D7, D6, D5, D4, D3, D2, D1, D0: GGGGGGXX 2nd write

D7, D6, D5, D4, D3, D2, D1, D0: BBBBXX 3rd write

A single pixel of data is read after the third write operation as shown, and it is written in the display RAM.

“X” is dummy bit, and it is ignored for display.

#### 2. 16 bit mode

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRRRXXGGGGGXX 1st write

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: BBBBXXXXXXXXXXXX 2nd write

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

## (4) Truncated 16M color input mode

### 1. 8-bit mode

D7, D6, D5, D4, D3, D2, D1, D0: RRRRRRRR 1st write

D7, D6, D5, D4, D3, D2, D1, D0: GGGGGGGG 2nd write

D7, D6, D5, D4, D3, D2, D1, D0: BBBBBBBB 3rd write

A single pixel of data is read after the third write operation as shown, and it is written in the display RAM.

### 2. 16 bit mode

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: RRRRRRRRGGGGGGGG 1st write

D15, D14, D13, D12, D11, D10, D9, D8, D7, D6, D5, D4, D3, D2, D1, D0: BBBBBBBBXXXXXXXX 2nd write

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

## 7.1.3 8- and 9-bit Serial Interface

The 8-bit serial interface uses four pins /CS, SI, SCL, and A0 to enter commands and data. Meanwhile, the 9-bit serial interface uses three pins /CS, SI and SCL for the same purpose.

Data read is not available in the serial interface. Data entered must be 8 bits. Refer to the following chart for entering commands, parameters or gray-scale data.

The relation between gray-scale data and data bus in the serial input is the same as that in the 8-bit parallel interface mode at every gradation.

### (1) 8-bit serial interface (4-line)

When entering data (parameters): A0= HIGH at the rising edge of the 8<sup>th</sup> SCL.

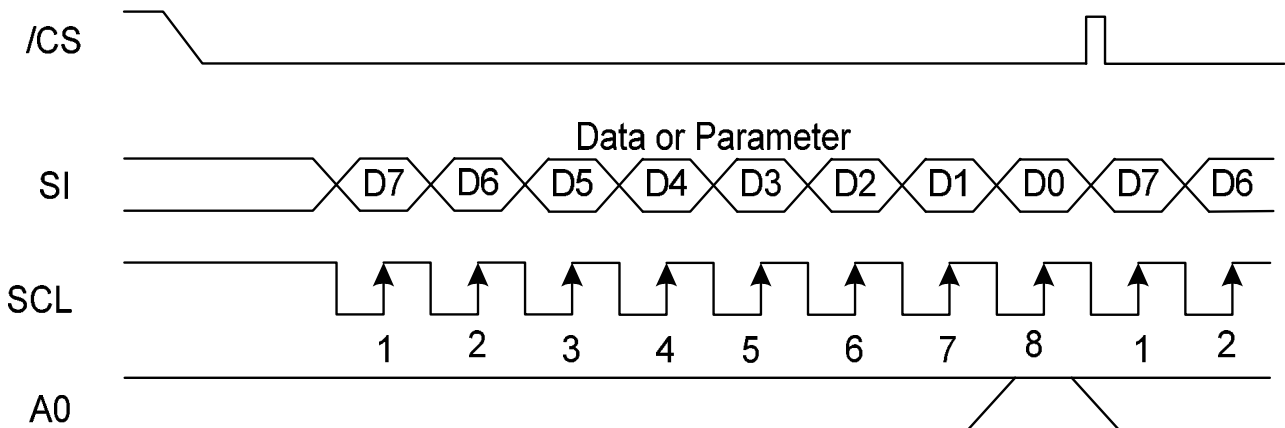

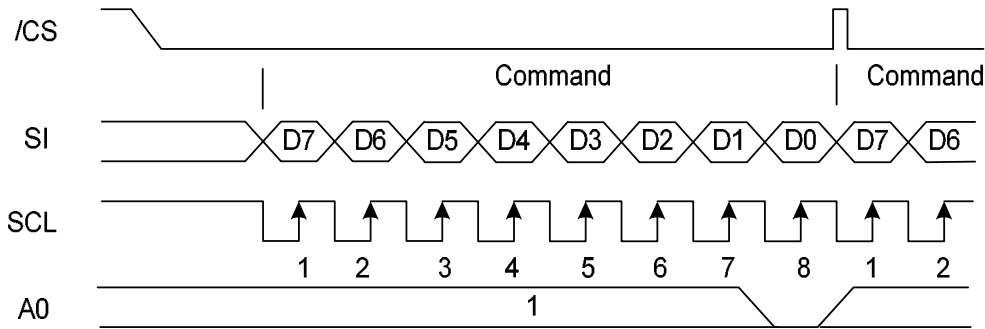

Figure 7.1.3 4-line explanation chart when entering data

When entering command: A0= LOW at the rising edge of the 8<sup>th</sup> SCL

**Figure 7.1.4 4-line explanation chart when entering command**

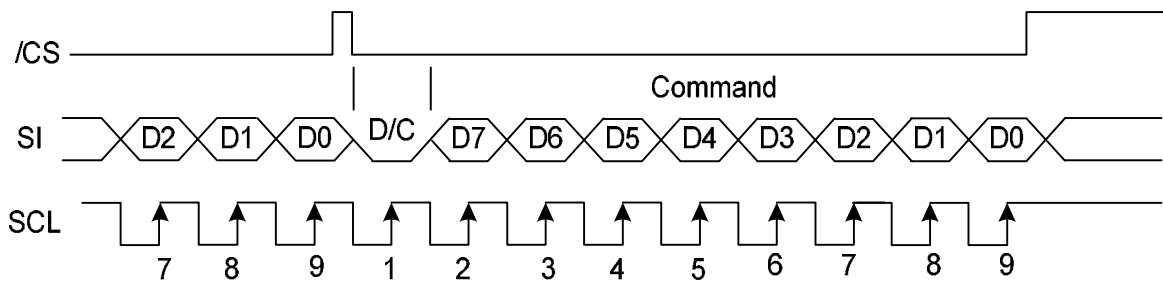

(2) 9-bit serial interface (3-line)

When entering data (parameters): SI= HIGH at the rising edge of the 1<sup>st</sup> SCL.

**Figure 7.1.5 3-line explanation chart when entering data**

When entering command: SI= LOW at the rising edge of the 1<sup>st</sup> SCL.

**Figure 7.1.6 3-line explanation chart when entering command**

- If /CS is set to HIGH while the 8 bits from D7 to D0 are entered, the data concerned is invalidated. Before entering succeeding sets of data, you must correctly input the data concerned again.
- In order to avoid data transfer error due to incoming noise, it is recommended to set /CS at HIGH on byte basis to initialize the serial-to-parallel conversion counter and the register.
- When executing the command RAMWR, set /CS to HIGH after writing the last address (after starting the 9<sup>th</sup> pulse in case of 9-bit serial input or after starting the 8<sup>th</sup> pulse in case of 8-bit serial input).

### 7.2 ACCESS TO DDRAM AND INTERNAL REGISTERS

ST7626 realizes high-speed data transfer because the access from MPU is a sort of pipeline processing done via the bus holder attached to the internal, requiring the cycle time alone without needing the wait time.

For example, when MPU writes data to the DDRAM, the data is once held by the bus holder and then written to the DDRAM before the succeeding write cycle is started. When MPU reads data from the DDRAM, the first read cycle is dummy and the bus holder holds the data read in the dummy cycle, and then it read from the bus holder to the system bus in the succeeding read cycle. Figure 7.2.1 illustrates these relations.

In 80-series interface mode:

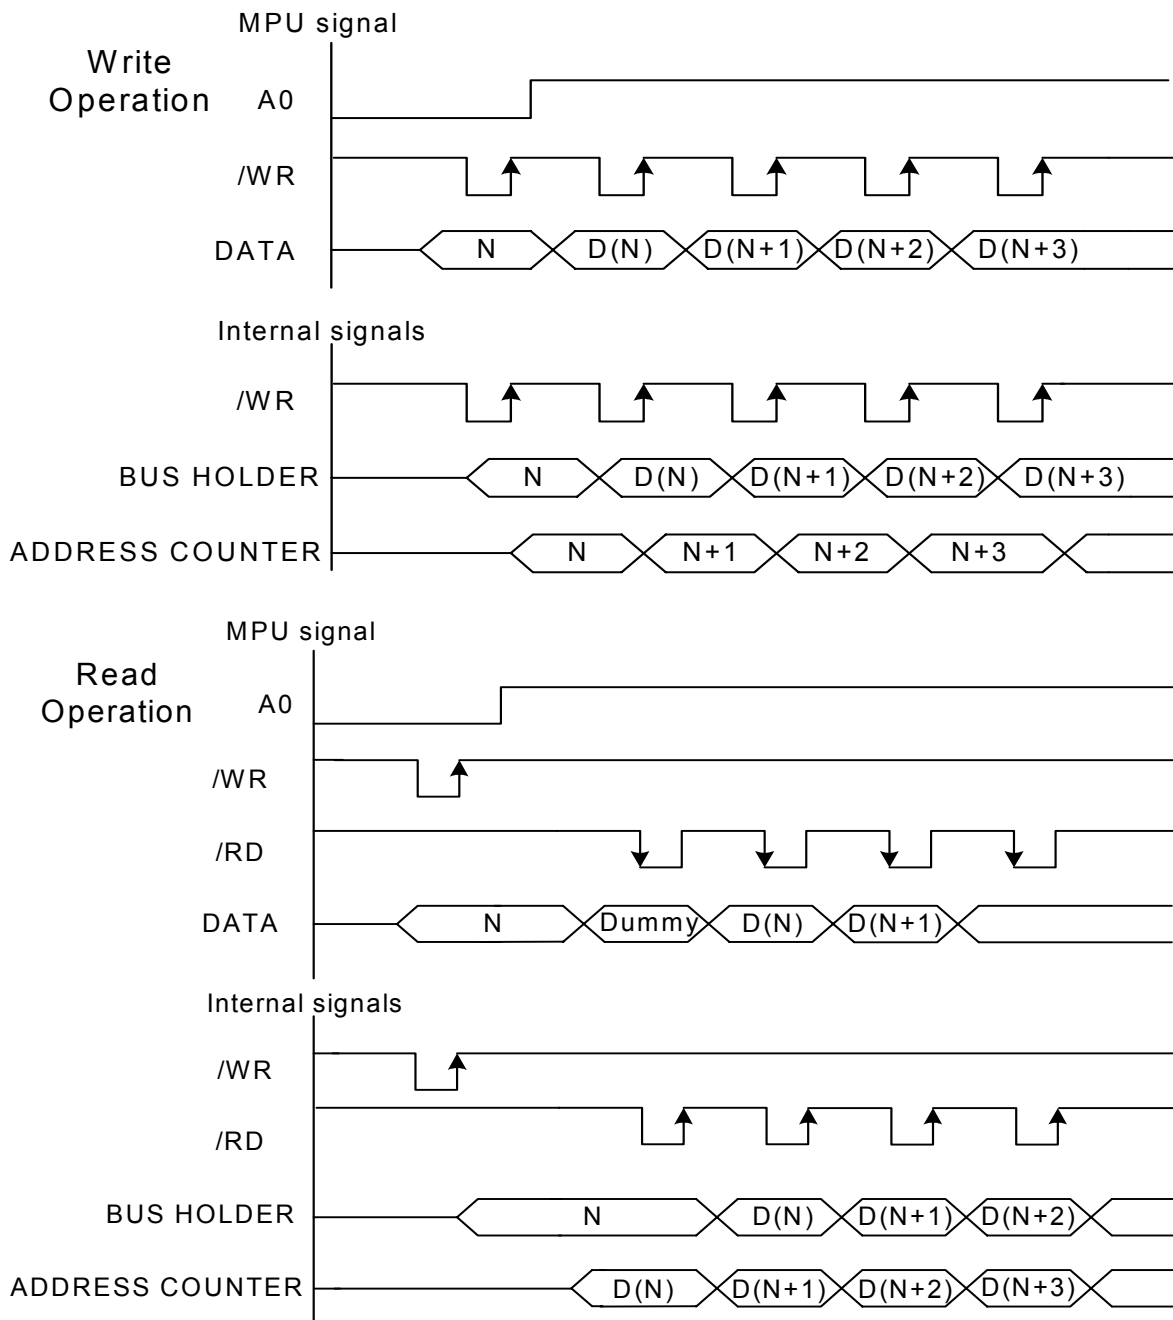

Figure 7.2.1 Access DDRAM chart

## 7.3 DISPLAY DATA RAM (DDRAM)

### 7.3.1 DDRAM

It is 98 X 68 X 16 bits capacity RAM prepared for storing dot data. You can access a desired bit by specifying the page address and column address. Since display data from MCU D7 to D0 and D15 to D8 correspond to one or two pixels of RGB, data transfer related restrictions are reduced, realizing the display flexing.

The RAM on ST7626 is separated to a block per 4 lines to allow the display system to process data on the block basis.

MPU's read and write operations to and from the RAM are performed via the I/O buffer circuit; Reading of the RAM for the liquid crystal drive is controlled from another separate circuit. Refer to the following memory map for the RAM configuration.

Memory Map (When using the Type A 4096 color. 8-bit mode)

## 7.3.2 Page Address Control Circuit

This circuit is used to control the address in the page direction when MPU accesses the DDRAM or when reading the DDRAM to display image on the LCD.

You can specify a scope of the page address with page address set command. When the page-direction scan is specified with DATACTL command and the address are incremented from the start up to the end page, the column address is incremented by 1 and the page address returns to start page.

The DDRAM supports up to 68 lines, and thus the total page becomes 68.

In the read operation, as the end page is reached, the column address is automatically incremented by 1 and the page address is returned to start page.

Using the address normal/inverse parameter of DATACTL command allows you to inverse the correspondence between the DDRAM address and command output.

## 7.3.3 Column Address Control Circuit

This circuit is used to control the address in the column direction when MPU accesses the DDRAM. You can specify a scope of the column address using column address set command. When the column-direction scan is specified with DATACTL command and the address are incremented from the start up to the end page, the page address is incremented by 1 and the column address returns to start column.

In the read operation, too, the column address is automatically incremented by 1 and returned to start page as the end column is reached.

Just like the page address control circuit, using the column address normal/inverse parameter of DATACTL command enables to inverse the correspondence between the DDRAM column address and segment output. This arrangement relaxes restrictions in the chip layout on the LCD module.

## 7.3.4 I/O Buffer Circuit

It is the bi-directional buffer used when MPU reads or writes the DDRAM. Since MPU's read or write of DDRAM is performed independently from data output to the display data latch circuit, asynchronous access to the DDRAM when the LCD is turned on does not cause troubles such as flicking of the display images.

## 7.3.5 Block Address Circuit

The circuit associates pages on DDRAM with COM output. ST7626 processes signals for the liquid crystal display on 4-page basis. Thus, when specifying a specific area in the area scroll display or partial display, you must designate it in block.

## 7.3.6 Display data Latch Circuit

This circuit is used to temporarily hold display data to be output from the DDRAM to the SEG decoder circuit. Since display normal/inverse and display on/off commands are used to control data in the latch circuit alone, they do not modify data in the DDRAM.

## 7.4 Area Scroll Display

Using area scroll set and scroll start set commands allows you to scroll the display screen partially. You can select any one of the following four scroll patterns.

**Figure 7.4.1 Scroll Mode explanation chart**

Example : In the center screen scroll of 1/48 duty (display range: 48 lines = 12 blocks)

- Set Area Scroll command (0x00AA)
- Block 0 and block 1 (8-lines) are specified for the top fixed area.  

$$\text{Top Block Address} = \text{Number of the top fixed area}$$

$$= 8 / 4 = 2 \text{ (0x0002)} \quad \text{parameter (0x0002)}$$
- Block 15 & block 16 (8-lines) are specified for the bottom fixed area.
- Block 10 to block 14 (20-lines) are specified for the background area.  

$$\text{Bottom Block Address} = \text{Number of Background area} + \text{Bottom Block Address}$$

$$= (20 / 4) + 9 = 14 \text{ (0x000E)} \quad \text{parameter (0x000E)}$$
- Block 2 to Block 9 (32-lines) are specified for the scroll area  

$$\text{Number of Specified Blocks} = ((\text{Top Fix Area} + \text{Scroll Area}) - 1)$$

$$= (2 + (12 - 2 - 2)) - 1 = 9 \text{ (0x0009)} \quad \text{parameter (0x0009)}$$
- Set area acroll mode – Center Screen Mode parameter (0x0000)

Figure 7.4.2 Reference Example for Scroll Display

## 7.5 Partial Display

Using partial in command allows you turn on the partial display (division by line) of the screen. This mode requires less current consumption than the whole screen display, making it suitable for the equipment in the standby state.

Figure 7.5.1 Partial Mode explanation chart

If the partial display region is out of the Max. Display range, it would be no operation

Figure 7.5.2 Reference Example for Partial Display

Figure 7.5.3 Partial Display (Partial Display Duty=16, initial COM0=0)

Figure 7.5.4 Moving Display (Partial Display Duty=16, initial COM0=8)

## 7.6 Gary-Scale Display

ST7626 incorporates a 4FRC & 31 PWM function circuit to display a 64 gray-scale display.

## 7.7 Oscillation circuit

This is on-chip Oscillator without external resistor. When the internal oscillator is used, CLS must connect to VDD; when the external oscillator is used, CL could be input pin. This oscillator signal is used in the voltage converter and display timing generation circuit.

### 7.8 Display Timing Generator Circuit

This circuit generates some signals to be used for displaying LCD. The display clock, CL (internal), generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 68-bits display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the microprocessor. The display clock generates an LCD AC signal (M), which enables the LCD driver to make an AC drive waveform, and also generates an internal common timing signal and start signal to the common driver. The frame signal or the line signal changes the M by setting internal instruction. Driving waveform and internal timing signal are shown in Figure 7.8.1.

Figure 7.8.1 2-frame AC Driving Waveform (Duty Ratio: 1/68)

Figure 7.8.2 N-Line Inversion Driving Waveform (N=5, Duty Ratio=1/64)

## 7.9 Liquid Crystal drive Circuit

This driver circuit is configured by 68-channel common drivers and 294-channel segment drivers. This LCD panel driver voltage depends on the combination of display data and M signal.

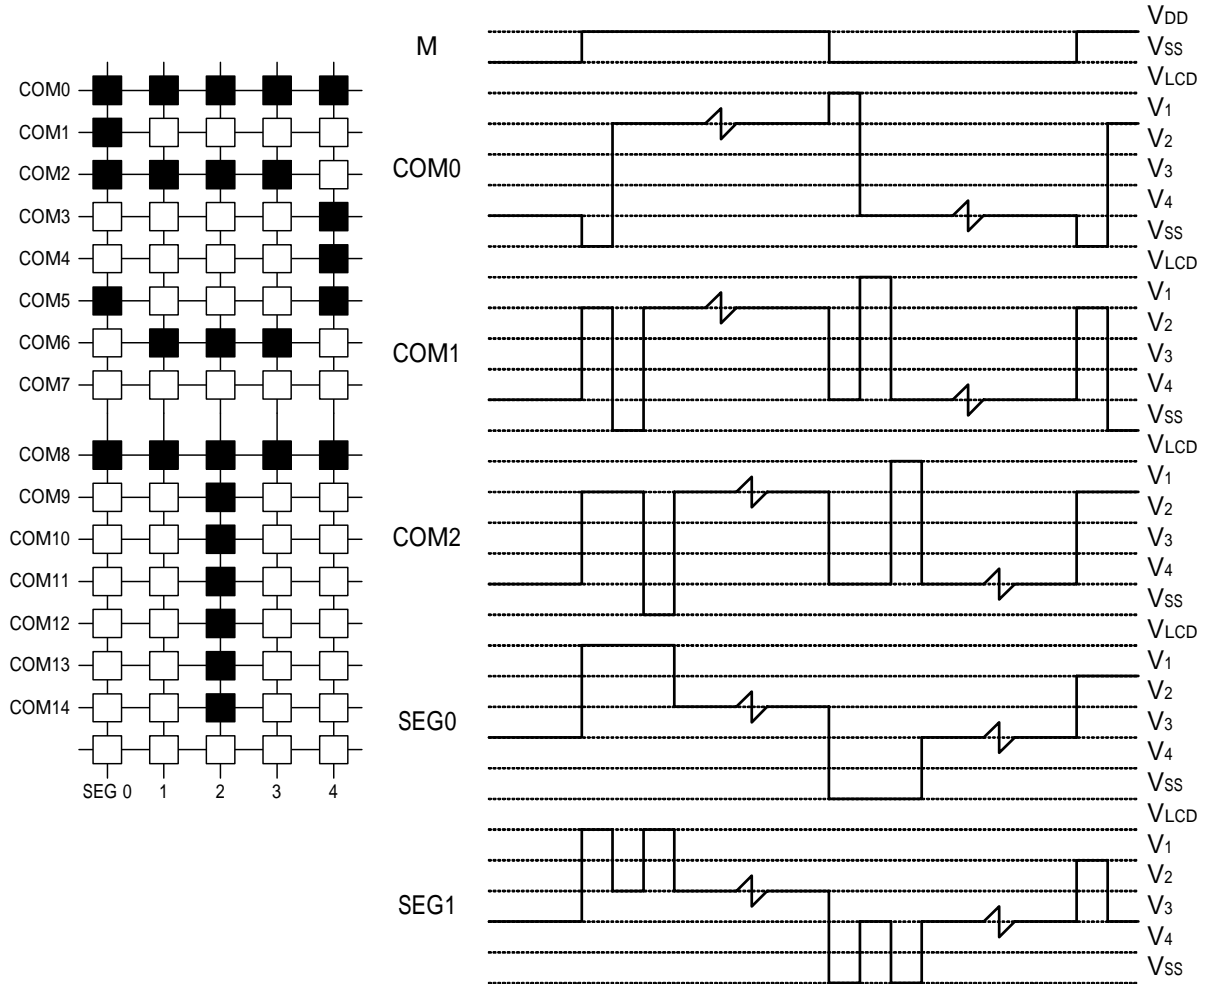

Figure 7.9.1 LCD Driving Waveform

## 7.10 Liquid Crystal Driver Power Circuit

The Power Supply circuits generate the voltage levels necessary to drive liquid crystal driver circuits with low power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are controlled by power control instruction. For details, refers to "Instruction Description". Table 7.10.1 shows the referenced combinations in using Power Supply circuits.

**Table 7.10.1 Recommended Power Supply Combinations**

User setup	Power control (VC VR VF)	V/C circuits	V/R circuits	V/F circuits	VLCD	V0	V1 to V4
Only the internal power supply circuits are used	1 1 1	ON	ON	ON	a capacitor is series to GND	Open*1	Open*1
Only the voltage regulator circuits and voltage follower circuits are used	0 1 1	OFF	ON	ON	External input	Open*1	Open*1
Only the voltage follower circuits are used	0 0 1	OFF	OFF	ON	Open	External input	Open*1
Only the external power supply circuits are used	0 0 0	OFF	OFF	OFF	Open	External input	External input

\*1 : ST7626 only needs one capacitor series VLCD to GND in normal situation. Add series-capacitors from V0~V4 to GND will improve display performance.

### 7.10.1 Voltage Converter Circuits

There is a built-in DC-DC voltage converter circuits in ST7626 for generating VLCD<sub>OUT</sub>. Multiple of voltage converter is 2, 3, 4, 5 times of V<sub>dd2</sub> toward positive side, and it can be controlled by software(Command ANASET). Please make sure that VLCD<sub>OUT</sub> must below 20V after turn on voltage converter circuit.

### 7.10.2 Voltage Regulator Circuits

There is a built-in voltage regulator circuits in ST7626 for generating V<sub>0OUT</sub>. After VLCD<sub>OUT</sub> is regulated by voltage regulator circuit, V<sub>0OUT</sub> is generated. Users also can use VOP function to program the optimum LCD supply voltage V<sub>0</sub> by software (Command SETVOP). Detail explanation of VOP-set is listed below:

#### SETVOP

Reset state of Vop[8:0] is 160DEC = 10.00V.

The VOP value is programmed via the Vop[8:0] register.

$$V0 = a + (Vop[8:6]Vop[5:0]) \cdot b$$

Ex: VOP[5:0]=100000, VOP[8:6]=010

→ Vop [8:0]=010100000

→  $3.6+210 \times 0.04=10.00$

- a is a fixed constant value (see table 7.10.2).
- b is a fixed constant value (see table 7.10.2).
- VOP[8:0] is the programmed VOP value. The programming range for VOP[8:0] is 5 to 410 (19Ahex).
- VOP[5:0] is the set-contrast value which can be set via the command SETVOP and EEPROM.(See command VOLUP & VOLDDOWN)
- The suggested value of V0 is under 11 V with bias =1/9.

**Table 7.10.2**

SYMBOL	VALUE	UNIT
a	3.6	V
b	0.04	V

The VOP[8:0] value must be in the VOP programming range as given in Figure 7.10.2. Evaluating equation (1), values outside the programming range indicated in Figure 7.10.2 may result. Calculated values below 4 will be mapped to VOP[8:0] = 4, resulting VOP[8:0] values higher than 410 will be mapped to VOP[8:0] = 410. Sitronix suggests Vop range equals 4.5V to 18V.

**Figure 7.10.2 VOP programming range**

# ST7626

As the programming range for the internally generated V0 voltage is above the limited V0 (18V), users has to ensure while setting the VOP register that under all conditions and including all tolerances that the V0 voltage remains below 18V.

**Table 7.10.3**

Par no.	Equipment Type	Thermal Gradient
ST7626	Internal Power Supply	-0.065%/°C @ V0=10.52V, 25°C

## 7.10.3 Voltage Follower Circuits

There is a built-in voltage follower circuits in ST7626 for generating V1, V2, V3 and V4. These voltages are decided by bias ratio selection circuitry which is set by users with software to control 1/5 to 1/12 bias ratios to match the optimum display performance of LCD panel. Bias driving rule is listed below:

**Table 7.10.4**

LCD bias	V1	V2	V3	V4
1/N bias	$(N-1) / N \times V0$	$(N-2) / N \times V0$	$(2/N) \times V0$	$(1/N) \times V0$

**N=5 to 12**

## 7.10.4 The Set-up Power Circuits

The ST7626 series has two modes of power circuit. One is 1 CAP with VLCDout, the other is 6 CAP with VLCDout/V0/V1/V2/V3/V4 (depend on panel loading). The detail circuit is as below.

**Figure 7.10.3 (a) 1 CAP power circuit**

**(b) 6 CAP power circuit**

**Notes: 1. VLCDout: 1.0~2.2uF/25V**

**2. V0~V4:0.1~1.0uF/25V**

## 7.10.5 EEPROM Setting Flow

### ◆ EEPROM Setting Flow

ST7626 provide the Write and Read function to write the Electronic Control value and Built-in resistance ratio into and read them from the built-in EEPROM. Using the Write and Read functions, you can store these values appropriate to each LCD panel. This function is very convenient for user in setting from some different panel's voltage.

Figure 7.10.5 EC value control for different modules by loading EEPROM offset

**Note1:** This setting flow is used for LCM assembler.

**Note2:** EEPROM shouldn't be written without preceding loading correctly from EEPROM to avoid some errors during IC operation.

**Note3:** When writing value to EEPROM, the voltage of VLCDin must be more than 18V.

**Note4:** When writing value to EEPROM, the voltage of VDD2~VDD5 must be 2.8~3.3V.

**Note5:** When writing value to EEPROM, the Regulator and Follower must turn OFF, and Display also must turn OFF.

**Note6:** If the EEPROM is exposed to a high temperature for hours, data in the memory cell may probably be lost before the data retention guarantee period. To retain data in the memory cell, keep the mamory cell below 90 . The data retention guarantee period is specified including the retention period.

## ◆ EEPROM Flow Chart

## ◆ Software Program

### A. Initial Flow

```
void ST7626_Init( void )
```

{

Write( COMMAND, 0xaf );	// Display On
Write( COMMAND, 0x30 );	// Ext = 0
}	

## B. Adjust Vop Offset

```
void adj_Vop_offset(void)
```

{	
int i,j=1;	
while(j)	
{	
if (KeyScan1==0)i=1;	// Define KeyScan1 for "D6" use
if (KeyScan2==0)i=2;	// Define KeyScan2 for "D7" use
if (KeyScan3==0)i=3;	// Define KeyScan3 for "write" use
if (KeyScan1==1 & KeyScan2==1 & KeyScan3==1)i=4;	// Jump to break
switch (i)	
{	
Case 1:	
Write( COMMAND, 0xd6 );	// Vop Offset +1 step
break;	
case 2:	
Write( COMMAND, 0xd7 );	// Vop Offset -1 step
break;	
case 3:	
write_7626eeprom();	// Write EEPROM Flow
j=0;	
break;	
default:	
break;	
}	
}	
}	

## C. Write EEPROM

```
void write_7626eeprom(void)
```

{	
Write( COMMAND, 0x30 );	// EXT=0
Write( COMMAND, 0xae );	// Display Off
Write( COMMAND, 0x20 );	// Power Control
Write( DATA, 0x08 );	// B/F/R = ON/OFF/OFF
Write( COMMAND, 0x31 );	// EXT=1
Write( COMMAND, 0xCD );	// Enable EEPROM Write Mode
Write( DATA, 0x20 );	//
delay(50000);	<i>//Delay 50 ms, the range is delay≥50ms</i>
Write( COMMAND, 0xeb );	// Select EEPROM
Write( DATA, 0x00 );	// EEPROM 1st byte
Write( COMMAND, 0xfc );	// Write Data to EEPROM
delay(50000);	<i>// Delay 50ms, the range is 10ms &lt; delay &lt; 80ms</i>
Write( COMMAND, 0xeb );	// Select EEPROM
Write( DATA, 0x01 );	// EEPROM 2nd byte

Write( COMMAND, 0xfc );	// Write Data to EEPROM
delay(50000);	//Delay 50 ms, the range is delay≥50ms
Write( COMMAND, 0xeb );	// Select EEPROM
Write( DATA, 0x02 );	// EEPROM 3rd byte
Write( COMMAND, 0xfc );	// Write Data to EEPROM
delay(50000);	// Delay 50ms, the range is 10ms < delay < 80ms
Write( COMMAND, 0xeb );	// Select EEPROM
Write( DATA, 0x03 );	// EEPROM 4th byte
Write( COMMAND, 0xfc );	// Write Data to EEPROM
delay(50000);	// Delay 50ms, the range is 10ms < delay < 80ms

## 8.2 EXT="0" Function Description

### (1) Display ON (DISON) Command: 1; Parameter: None (AFH)

It is used to turn the display on. When the display is turned on, segment outputs and common outputs are generated at the level corresponding to the display data and display timing. You can't turn on the display as long as the sleep mode is selected. Thus, whenever using this command, you must cancel the sleep mode first.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	1	1	1	1

### (2) Display OFF (DISOFF) Command: 1; Parameter: None (AEH)

It is used to forcibly turn the display off. As long as the display is turned off, every on segment and common outputs are forced to VSS level.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	1	1	1	0

### (3) Normal display (DISNOR) Command: 1; Parameter: None (A6H)

It is used to normally highlight the display area without modifying contents of the display data RAM.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	0	1	1	0

### (4) Inverse display (DISINV) Command: 1; Parameter: None (A7)

It is used to inversely highlight the display area without modifying contents of the display data RAM. This command does not invert non-display areas in case of using partial display.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	0	1	1	1

### (5) Common scan (COMSCAN) Command: 1; Parameter: 1 (BBH)

It is used to specify the common output direction in the pin of CSEL = L. This command helps increasing degrees of freedom of wiring on the LCD panel.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	1	1	1	0	1	1	-
Parameter1 (P1)	1	1	0	*	*	*	*	*	P12	P11	P10	Command Scan direction

When CSEL=0 configuration is selected, pins and common outputs are scanned in the order shown below.

P12	P11	P10	Common scan direction					
			COM0 pin	COM33 pin	COM34 pin	COM67 pin		
0	0	0	0	→	33	34	→	67
0	0	1	0	→	33	67	→	34
0	1	0	33	→	0	34	→	67
0	1	1	33	→	0	67	→	34

## Common scan direction

Original graphic:

P12:P11:P10:0:0:0 (0→33, 34→67)

P12:P11:P10:0:0:1 (0→33, 67→34)

P12:P11:P10:0:1:0 (33→0, 34→67)

P12:P11:P10:0:1:1 (33→0, 67→34)

### (6) Display control (DISCTL) Command: 1; Parameter: 3 (CAH)

This command and succeeding parameters are used to perform the display timing-related setups. This command must be selected before using SLPOUT. Don't change this command while the display is turned on.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	1	0	0	1	0	1	0	-
Parameter1(P1)	1	1	0	*	*	*	P14	P13	P12	*	*	CL dividing ratio, F1 and F2 drive pattern.
Parameter2(P2)	1	1	0	*	*	*	P24	P23	P22	P21	P20	Drive duty
Parameter3(P3)	1	1	0	0	P36	P35	P34	P33	P32	P31	P30	FR inverse-set value

# ST7626

P1: it is used to specify the CL dividing ratio.

P14, P13, P12: CL dividing ratio. They are used to change number of dividing stages of external or internal clock.

P14	P13	P12	CL dividing ratio
0	0	0	Not divide
0	0	1	2 divisions
0	1	0	4 divisions
0	1	1	8 divisions

P2: It is used to specify the duty of the module on block basis.

Duty	*	*	*	P24	P23	P22	P21	P20	(Numbers of display lines)/4-1
Example: 1/68 duty	0	0	0	0	1	1	1	1	64/4-1=15

This will output driving voltage waveforms from com0 to com63.

P3: It is used to specify number of lines to be inversely highlighted on LCD panel from P36 to P30 (lines can be inversely highlighted in the range of 2 to 64)

Inversely highlighted line	P37	P36	P35	P34	P33	P32	P31	P30	Inversely highlighted lines-1
Example: 0AH	0	0	0	0	1	0	1	0	11 (lines)-1 = 10 (lines)
Example: 7CH	0	1	1	1	1	1	0	0	61 (lines)-1 = 60 (lines)

P34="0": Frame inversion occurs every frame; P34="1": Independent from frames.

In the default, 0 inverse highlighted line is selected.

## (7) Sleep In/Out Preparation (SLPP) Command: 1; Parameter: 1

Using this command to setup ready status for sleep-in or sleep out.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	0	0	0	0	1	0	0	-
<b>Parameter(P1)</b>	1	1	0	0	0	1	1	1	1	1	P10	Sleep in/out ready

P10 = "1": Ready for sleep in. P10 = "0": Ready for sleep out.

Parameter 3FH is used to initialize sleep-in sequencing, and parameter 3EH is used to initialize sleep-out sequencing.

## (8) Sleep in (SPLIN) Command: 1; Parameter: None (95H)

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	0	0	1	0	1	0	1

## (9) Sleep out (SLPOUT) Command: 1; Parameter: None (94H)

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	0	0	1	0	1	0	0

## (10) Page address set (PASET) Command: 1; Parameter: 2 (75H)

When MPU makes access to the display data RAM, this command and succeeding parameters are used to specify the page address area. As the addresses are incremented from the start to the end page in the page-direction scan, the column address is incremented by 1 and the page address is returned to the start page.

Note: that the start and end page must be specified as a pair. Also, the relation "start page < end page" must be maintained.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	1	1	1	0	1	0	1	-
<b>Parameter1(P1)</b>	1	1	0	*	P16	P15	P14	P13	P12	P11	P10	Start page
<b>Parameter2(P2)</b>	1	1	0	*	P26	P25	P24	P23	P22	P21	P20	End page

## (11) Column address set (CASET) Command: 1; Parameter: 2 (15H)

When MPU makes access to the display data RAM, this command and succeeding parameters are used to specify the column address area. As the addresses are incremented from the start to the end column in the column-direction scan, the page address is incremented by 1 and the column address is returned to the start column.

Note: that the start and end column must be specified as a pair. Also, the relation "start column < end column" must be maintained.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	0	0	1	0	1	0	1	-
<b>Parameter1(P1)</b>	1	1	0	*	P16	P15	P14	P13	P12	P11	P10	Start address
<b>Parameter2(P2)</b>	1	1	0	*	P26	P25	P24	P23	P22	P21	P20	End address

## (12) Data control (DATCTL) Command: 1; Parameter: 3 (BCH)

This command and succeeding parameters are used to perform various setups needed when MPU operates display data stored on the built-in RAM.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	1	0	1	1	1	1	0	0	-
<b>Parameter1(P1)</b>	1	1	0	*	*	*	*	*	P12	P11	P10	Normal/inverse display of page/column address and address scan direction.
<b>Parameter2(P2)</b>	1	1	0	*	*	*	*	*	*	*	P20	RGB arrangement
<b>Parameter3(P3)</b>	1	1	0	*	*	*	*	*	P32	P31	P30	Gray-scale setup

P1: It is used to specify the normal or inverse display of the page / column address and also to specify the address scanning direction.

P10: Normal/inverse display of the page address. P10=0: Normal and P10=1: Inverse

P11: Normal/reverse turn of column address. P11=0: Normal rotation and P11=1: Reverse rotation.

P12: Address-scan direction. P12=0: In the column direction and P12=1: In the page direction.

## Page address and page-address scan direction

P12=0 Column direction

P12=1 Page direction

P2: RGB arrangement. This parameter allows you to change RGB arrangement of data which is going to be written into RAM, and therefore causes the inverse RGB rotation of the segment output of ST7626. You can fit RGB arrangement on the LCD panel according to this parameter setting.

P20	SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	SEG6	SEG7	...	SEG293
0	R	G	B	R	G	B	R	G	...	B
1	B	G	R	B	G	R	B	G	...	R

P3: Gray scale setup. Using this parameter, you can select the 4K, 65K, 262K, and 16M display mode depending on the difference in RGB data arrangement.

P32	P31	P30	Numbers of gray-scale
0	0	1	64-gray 65K
0	1	0	64-gray 262K
1	0	0	64-gray 16M
1	0	1	16-gray 4K Type A
1	1	0	16-gray 4K Type B

## (13) Memory write (RAMWR) Command: 1; Parameter: Numbers of data written (5CH)

When MPU writes data to the display memory, this command turns on the data entry mode. Entering this command always sets the page and column address at the start address. You can rewrite contents of the display data RAM by entering data succeeding to this command. At the same time, this operation increments the page or column address as applicable. The write mode is automatically cancelled if any other command is entered.

### 1. 8-bit bus

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	1	0	1	1	1	0	0	-
<b>Parameter</b>	1	1	0	Data to be written							Data to be written	

### 2. 16-bit bus

	A0	RD	RW	D15	D14	...	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	*	*	...	*	*	0	1	0	1	1	1	0	0	Memory write
<b>parameter</b>	1	1	0	Data to be written												Write data	

## (14) Memory read (RAMRD) Command: 1; Parameter: Numbers of data read (5DH)

When MPU read data from the display memory, this command turns on the data read mode. Entering this command always sets the page and column address at the start address. After entering this command, you can read contents of the display data RAM. At the same time, this operation increments the page or column address as applicable. The data read mode is automatically cancelled if any other command is entered.

### 1. 8-bit bus

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	1	0	1	1	1	0	1	-
<b>Parameter</b>	1	0	1	Data to be read							Data to be read	

### 2. 16-bit bus

	A0	RD	RW	D15	D14	....	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	*	*	*	*	*	0	1	0	1	1	1	0	1	Memory read
<b>parameter</b>	1	0	1	Data to be read												Read data	

## (15) Partial in (PTLIN) Command: 1; Parameter: 2 (A8H)

This command and succeeding parameters specify the partial display area. This command is used to turn on partial display of the screen (dividing screen by lines) in order to save power. Since ST7626 processes the liquid crystal display signal on 4-line basis (block basis), the display and non-display areas are also specified on 4-bit line (block basis).

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	1	0	1	0	1	0	0	0	-
<b>Parameter(P1)</b>	1	1	0	*	*	*	P14	P13	P12	P11	P10	Start block address
<b>Parameter(P2)</b>	1	1	0	*	*	*	P24	P23	P22	P21	P20	End block address

A block address that can be specified for the partial display must be the display one (don't try to specify an address not to be displayed when scrolled).

**(16) Partial out (PTLOUT) Command: 1; Parameter: 0 (A9H)**

This command is used to exit from the partial display mode.

	<b>A0</b>	<b>RD</b>	<b>RW</b>	<b>D7</b>	<b>D6</b>	<b>D5</b>	<b>D4</b>	<b>D3</b>	<b>D2</b>	<b>D1</b>	<b>D0</b>
<b>Command</b>	0	1	0	1	0	1	0	1	0	0	1

**(17) Read modify write in (RMWIN) Command: 1; Parameter: 0 (E0H)**

This command is used along with the column address set command, page address set command and read modify write out command. This function is used when frequently modifying data to specify a specific display area such as blinking cursor.

First set a specific display area using the column and page address commands. Then, enter this command to set the column and page addresses at the start address of the specific area. When this operation is complete, the column (page) address won't be modified by the display data read command. It is incremented only when the display data write command is used. You can cancel this mode by entering the read modify write out or any other command.

	<b>A0</b>	<b>RD</b>	<b>RW</b>	<b>D7</b>	<b>D6</b>	<b>D5</b>	<b>D4</b>	<b>D3</b>	<b>D2</b>	<b>D1</b>	<b>D0</b>
<b>Command</b>	0	1	0	1	1	1	0	0	0	0	0

**(18) Read modify write out (RMWOUT) Command: 1; Parameter: 0 (EEH)**

Enter this command cancels the read modify write mode

	<b>A0</b>	<b>RD</b>	<b>RW</b>	<b>D7</b>	<b>D6</b>	<b>D5</b>	<b>D4</b>	<b>D3</b>	<b>D2</b>	<b>D1</b>	<b>D0</b>
<b>Command</b>	0	1	0	1	1	1	0	1	1	1	0

**(19) Area scroll set (ASCSET) Command: 1; Parameter: 4 (AAH)**

It is used when scrolling only the specified portion of the screen (dividing the screen by lines). This command and succeeding parameters specify the type of area scroll, fix area and scroll area.

	<b>A0</b>	<b>RD</b>	<b>RW</b>	<b>D7</b>	<b>D6</b>	<b>D5</b>	<b>D4</b>	<b>D3</b>	<b>D2</b>	<b>D1</b>	<b>D0</b>	<b>Function</b>
<b>Command</b>	0	1	0	1	0	1	0	1	0	1	0	-
<b>Parameter(P1)</b>	1	1	0	*	*	*	P14	P13	P12	P11	P10	Top block address
<b>Parameter(P2)</b>	1	1	0	*	*	*	P24	P23	P22	P21	P20	Bottom block address
<b>Parameter(P3)</b>	1	1	0	*	*	*	P34	P33	P32	P31	P30	Number of specified blocks
<b>Parameter(P4)</b>	1	1	0	*	*	*	*	*	*	P41	P40	Area scroll mode

P4: It is used to specify an area scroll mode.

P41	P40	Type of area scroll
0	0	Center screen scroll
0	1	Top screen scroll
1	0	Bottom screen scroll
1	1	Whole screen scroll

Since ST7626 processes the liquid crystal display signals on the four-line basis (block basis), FIX and scroll areas are also specified on the four-line basis (block basis).

DDRAM address corresponding to the top FIX area is set in the block address incrementing direction starting with 0 block. DDRAM address corresponding to the bottom FIX area is set in the block address decreasing direction starting with 16<sup>st</sup> block. Other DDRAM blocks excluding the top and bottom FIX areas are assigned to the scroll + background areas.

P1: It is used to specify the top block address of the scroll + background areas. Specify the 0<sup>th</sup> block for the top screen scroll or whole screen scroll.

P2: It specifies the bottom address of the scroll+ background areas. Specify the 16<sup>th</sup> block for the bottom or whole screen scroll.

Required relation between the start and end blocks (top block address < bottom block address) must be maintained.

P3: It specifies a specific number of blocks {Numbers of (Top FIX area + Scroll area) block-1}. When the bottom scroll or whole screens scroll, the value is identical with P2.

You can turn on the area scroll function by executing the area scroll set command first and then specifying the display start block of the scroll area with the scroll start set command.

### *[Area Scroll Setup Example]*

In the center screen scroll of 1/48 duty (display range: 48 lines = 12 blocks), if 8 lines = 2 blocks and 8 lines = 2 blocks are specified for the top and bottom FIX areas, 36 lines = 9 blocks is specified for the scroll areas, respectively, 16 lines = 4 blocks on the DDRAM are usable as the background area. Value of each parameter at this time is as shown below.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	
<b>P1</b>	1	1	0	*	*	*	0	0	0	1	0	Top block address = 02 H
<b>P2</b>	1	1	0	*	*	*	0	1	1	1	0	Bottom block address = 0E H
<b>P3</b>	1	1	0	*	*	*	0	1	1	0	0	Number of specific blocks = 09 H
<b>P4</b>	1	1	0	*	*	*	*	*	*	0	0	Area scroll mode = center

## (20) Scroll start address set (SCSTART) Command:1 Parameter: 1 (ABH)

This command and succeeding parameters are used to specify the start block address of the scroll area.

Note: that you must execute this command after executing the area scroll set command. Scroll becomes available by dynamically changing the start block address.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	1	0	1	0	1	0	1	1	-
<b>Parameter(P1)</b>	1	1	0	*	*	*	P14	P13	P12	P11	P10	Start block address

## (21) Internal oscillation on (OSCON) Command: 1; Parameter: 0 (D1H)

This command turns on the internal oscillation circuit. It is valid only when the internal oscillation circuit of CLS = HIGH is used.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	0	1	0	0	0	1

## (22) Internal oscillation off (OSOFF) Command: 1; Parameter: 0 (D2H)

It turns off the internal oscillation circuit. This circuit is turned off in the reset mode.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	0	1	0	0	1	0

## (23) Power control set (PWRCTR) Command: 1; Parameter: 1 (20H)

This command is used to turn on or off the Booster circuit, follower voltage, and voltage regulator circuit.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	1	0	0	1	0	0	0	0	0	-
<b>Parameter(P1)</b>	1	1	0	*	*	*	0	P13	0	P11	P10	LCD drive power

P10: It turns on or off the voltage regulator voltage.

P10 = "1": ON. P10 = "0": OFF

P11: It turns on or off the follower circuit.

P11 = "1": ON. P11 = "0": OFF

P13:It turns on or off the Booster.

P13 = "1": ON. P13 = "0": OFF

## (24) Electronic volume control (VOLCTR) Command: 1; Parameter: 2 (81H)

The command is used to program the optimum LCD supply voltage VOP. Reference to 7.10.2

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	1	0	0	0	0	0	0	1	-
<b>Parameter(P1)</b>	1	1	0	*	*	P15	P14	P13	P12	P11	P10	Set Vop[5:0]
<b>Parameter(P2)</b>	1	1	0	*	*	*	*	*	P18	P17	P16	Set Vop[8:6]

## (25) Increment electronic control (VOLUP) Command: 1; Parameter: 0 (D6H)

With the VOLUP and VOLDDOWN command the VOP voltage and therewith the contrast of the LCD can be adjusted.

This command increments electronic control value Vop[5:0] of voltage regulator circuit by 1.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	0	1	0	1	1	0

If you set the electronic control value to 111111, the control value is set to 000000 after this command has been executed.

## (26) Decrement electronic control (VOLDDOWN) Command: 1; Parameter: 0 (D7H)

With the VOLUP and VOLDDOWN command the VOP voltage and therewith the contrast of the LCD can be adjusted.

This command decrements electronic control value Vop[5:0] of voltage regulator circuit by 1.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	0	1	0	1	1	1

If you set the electronic control value to 000000, the control value is set to 111111 after this command has been executed.

Table 8.1.1 Possible Vop[5:0] values

Electronic Control Value	Decimal Equivalent	VOP Offset
111111	31	+1240 mV
111110	30	+1200 mV
111101	29	+1160 mV
...	...	...
000010	2	+80 mV
000001	1	+40 mV
000000	0	0 mV
111111	-1	-40 mV
111110	-2	-80 mV
...	...	...
100010	-30	-1200 mV
100001	-31	-1240 mV
100000	-32	-1280mV

## (27) Status read (STREAD) Command: 1; Parameter: None

It is the command for reading the internal condition of the IC.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	0	1	(8) Status data							

Issue STREAD (Status Read) command is only for reading the internal condition of the IC. One status data can be displayed depending on the setting. Issue the NOP command after the STREAD (Status Read) command.

The Status data will be composed of 8 bits below:

D7: Area scroll mode	Refer to P41 (ASCSET)	
D6: Area scroll mode	Refer to P40 (ASCSET)	
D5: RMW on/off	0 : Out	1 : In
D4: Scan direction	0 : Column	1 : Page
D3: Display ON/OFF	0 : OFF	1 : ON
D2: EEPROM access	0: OutAccess	1: InAccess
D1: Display normal/inverse	0 : Normal	1 : Inverse
D0: Partial display	0 : OFF	1 : ON

## (28) Read Register 1 (EPSRRD1) Command: 1; Parameter: 0 (7CH)

It is the command for reading the Electronic Control values.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	1	1	1	1	1	0	0

Issue the EPSRRD1 and then STREAD (Status Read) commands in succession to read the Electronic Control values. One status data can be displayed depending on the setting. Also, always issue the NOP command after the STREAD (Status Read) command.

The Status data will be composed of 8 bits below:

D7: 0	
D6: 0	
D[5:0]: Vop[5:0]	Refer to electronic volume control values Vop[5:0]

## (29) Read Register 2 (EPSRRD2) Command: 1 ;Parameter: 0 (7DH)

It is the command for reading ID codes of the ST7626 and the built-in resistance ratio.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	0	1	1	1	1	1	0	1

Issue the EPSRRD2 and then STREAD (Status Read) commands in succession to read IC's ID and the built-in resistance ratio. One status data can be displayed depending on the setting. Also, always issue the NOP command after the STREAD (Status Read) command.

The Status data will be composed of 8 bits below:

D[7:3]: ST7626 ID codes                    00010

D[2:0]: Vop[8:6]                            Refer to the built-in resistance ratio Vop[8:6]

## (30) Non-operating (NOP) Command: 1; Parameter: 0 (25H)

This command does not affect the operation.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	0	0	1	0	0	1	0	1

This command, however, has the function of canceling the IC test mode. Thus, it is recommended to enter it periodically to prevent malfunctioning due to noise and such.

## (31) EEPROM Function Start (EEOK) Command:1;Parameter:1(07H)

In the EEPROM read/write flow, EEPROM is ready after issuing this command. Its parameter is set to 19H.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	0	0	0	0	1	1	1	-
<b>Parameter(P1)</b>	1	1	0	0	0	0	1	1	0	0	1	19H

## (32) Reserved (82H)

Do not use this command

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	0	0	0	0	0	1	0

## 8.3 EXT="1" Function Description

(1) Set Frame1 value (Frame1 set) Command: 1; Parameter: 16 (20H)

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Frame1 Set	0	1	0	0	0	1	0	0	0	0	0	FRAME 1 PWM Set

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	0	1	0	0	0	0	0	-
Parameter1(P1)	1	1	0	*	*	*	P14	P13	P12	P11	P10	Set RGB level 0 of 1st frame
Parameter2(P2)	1	1	0	*	*	*	P24	P23	P22	P21	P20	Set RGB level 1 of 1st frame
Parameter15(P15)	1	1	0	*	*	*	P154	P153	P152	P151	P150	Set RGB level 14 of 1st frame
Parameter16(P16)	1	1	0	*	*	*	P164	P163	P162	P161	P160	Set RGB level 15 of 1st frame

(2)Set Frame2 value (Frame2 set) Command: 1; Parameter: 16 (21H)

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Frame2 Set	0	1	0	0	0	1	0	0	0	0	1	FRAME 2 PWM Set

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	0	1	0	0	0	0	0	-
Parameter1(P1)	1	1	0	*	*	*	P14	P13	P12	P11	P10	Set RGB level 0 of 2nd frame
Parameter2(P2)	1	1	0	*	*	*	P24	P23	P22	P21	P20	Set RGB level 1 of 2nd frame
Parameter15(P15)	1	1	0	*	*	*	P154	P153	P152	P151	P150	Set RGB level 14 of 2nd frame
Parameter16(P16)	1	1	0	*	*	*	P164	P163	P162	P161	P160	Set RGB level 15 of 2nd frame

(3) Set Frame3 value (Frame3 set) Command: 1; Parameter: 16 (22H)

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Frame3 Set	0	1	0	0	0	1	0	0	0	1	0	FRAME 3 PWM Set

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	0	1	0	0	0	0	0	-
Parameter1(P1)	1	1	0	*	*	*	P14	P13	P12	P11	P10	Set RGB level 0 of 3rd frame
Parameter2(P2)	1	1	0	*	*	*	P24	P23	P22	P21	P20	Set RGB level 1 of 3rd frame
Parameter15(P15)	1	1	0	*	*	*	P154	P153	P152	P151	P150	Set RGB level 14 of 3rd frame
Parameter16(P16)	1	1	0	*	*	*	P164	P163	P162	P161	P160	Set RGB level 15 of 3rd frame

## (4) Set Frame4 value (Frame4 set) Command: 1; Parameter: 16 (23H)

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Frame4 Set	0	1	0	0	0	1	0	0	0	1	1	FRAME 4 PWM Set

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	0	1	0	0	0	0	0	-
Parameter1(P1)	1	1	0	*	*	*	P14	P13	P12	P11	P10	Set RGB level 0 of 4th frame
Parameter2(P2)	1	1	0	*	*	*	P24	P23	P22	P21	P20	Set RGB level 1 of 4th frame
Parameter15(P15)	1	1	0	*	*	*	P154	P153	P152	P151	P150	Set RGB level 14 of 4th frame
Parameter16(P16)	1	1	0	*	*	*	P164	P163	P162	P161	P160	Set RGB level 15 of 4th frame

### The default value of RGB level set

	FRAM1 SET	FRAM2 SET	FRAM3 SET	FRAME4 SET
RGB level0	00	00	00	00
RGB level1	02	02	02	02
RGB level2	04	04	04	04
RGB level3	06	06	06	06
RGB level4	08	08	08	08
RGB level5	0A	0A	0A	0A
RGB level6	0C	0C	0C	0C
RGB level7	0E	0E	0E	0E
RGB level8	10	10	10	10
RGB level9	12	12	12	12
RGB level10	14	14	14	14
RGB level11	16	16	16	16
RGB level12	18	18	18	18
RGB level13	1A	1A	1A	1A
RGB level14	1C	1C	1C	1C
RGB level15	1E	1E	1E	1E

All the modulation range of each level for each frame is from 00'H to 1F'H.

### Example : Paint setup

```
void LoadPaint( void )
{
    Write( COMMAND, 0x0031 );           // Ext = 1

    Write( COMMAND, 0x0020 );           // Palette FRC1 Setup
    Write( DATA, 0x0000 );             // RGB Level0 Setup
    Write( DATA, 0x0002 );             // RGB Level1 Setup
    Write( DATA, 0x0005 );             // RGB Level2 Setup
}
```

```

.....
Write( DATA, 0x001E );           // RGB Level15 Setup

Write( COMMAND, 0x0021 );        // Palette FRC2 Setup
Write( DATA, 0x0000 );         // RGB Level0 Setup
Write( DATA, 0x0002 );         // RGB Level1 Setup
Write( DATA, 0x0005 );         // RGB Level2 Setup

.....
Write( DATA, 0x001E );           // RGB Level15 Setup

Write( COMMAND, 0x0022 );        // Palette FRC3 Setup
Write( DATA, 0x0000 );         // RGB Level0 Setup
Write( DATA, 0x0002 );         // RGB Level1 Setup
Write( DATA, 0x0005 );         // RGB Level2 Setup

.....
Write( DATA, 0x001E );           // RGB Level15 Setup

Write( COMMAND, 0x0023 );        // Palette FRC4 Setup
Write( DATA, 0x0000 );         // RGB Level0 Setup
Write( DATA, 0x0002 );         // RGB Level1 Setup
Write( DATA, 0x0005 );         // RGB Level2 Setup

.....
Write( DATA, 0x001E );           // RGB Level15 Setup

Write( COMMAND, 0x0030 );        // Ext = 0
}

```

### (5) Analog set (ANASET) Command 1; Parameter: 3 (32H)

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	0	0	1	1	0	0	1	0	-
<b>Parameter1(P1)</b>	1	1	0	*	*	*	*	*	P12	P11	P10	OSC frequency Adjustment
<b>Parameter2(P2)</b>	1	1	0	*	*	*	*	*	*	P21	P20	Booster Efficiency Set
<b>Parameter3(P3)</b>	1	1	0	*	*	*	*	*	P32	P31	P30	Bias setting
<b>Parameter4(P4)</b>	1	1	0	*	*	*	*	*	P42	P41	P40	Booster setting

P1: OSC frequency adjustment

P12	P10	P10	CL pin frequency ( KHz ) : CL dividing ratio setting = 00H (No division)	CL pin frequency ( KHz ) : CL dividing ratio setting = 04H (Divided by 2)
0	0	0	5.39	2.70
0	0	1	5.64	2.82
0	1	0	6.18	3.09
0	1	1	6.83	3.42
1	0	0	7.65	3.82
1	0	1	8.68	4.34
1	1	0	10.10	5.05
1	1	1	12.02	6.01

OSC frequency can be adjusted by P1 setting and command CAH, see page 46.

The default OSC frequency (CL pin frequency) is 5.39 KHz.

And the frame frequency is from OSC frequency and duty setting, as the formula shown below:

$$\text{Frame frequency} = \text{OSC frequency} / (\text{Duty} + 1)$$

Example:

1. duty=68, P1 setting=[000], frame frequency=5.39KHz/78.12Hz
2. duty=64, P1 setting=[101], frame frequency=8.68KHz/133.53Hz

P2: Booster Efficiency set

P21	P20	Frequency ( Hz )
0	0	Level 1
0	1	Level 2
1	0	Level 3
1	1	Level 4

By Booster Stages (2X, 3X, 4X, 5X) and Booster Efficiency (Level1~4) commands, we could easily set the best Booster performance with suitable current consumption. If the Booster Efficiency is set to lower level (level1 is higher than level4). The Boost Efficiency is better than higher level, and it just need few more power consumption current.

P3: Select LCD bias ratio of the voltage required for driving the LCD.

P32	P31	P30	LCD bias
0	0	0	1/12
0	0	1	1/11
0	1	0	1/10
0	1	1	1/9
1	0	0	1/8
1	0	1	1/7
1	1	0	1/6
1	1	1	1/5

P4: Booster setting.

P42	P41	P40	
0	0	0	Booster off
0	0	1	2 times boosting circuit
0	1	0	3 times boosting circuit
0	1	1	4 times boosting circuit
1	0	0	5 times boosting circuit

## (6) Control EEPROM: 1; Parameter: 1 (CDH)

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	0	0	1	1	0	1
<b>Parameter1(P1)</b>	1	1	0	*	*	P15	*	*	*	*	*

P15: when setting "1" → The Write Enable of EEPROM will be opened.

P15: when setting "0" → The Read Enable of EEPROM will be opened.

## (7) Cancel EEPROM Command: 1; Parameter: None (CCH)

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	0	0	1	1	0	0

## (8) Write data to EEPROM (EPMWR) Command: 1; Parameter: None (FCH)

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	1	1	1	1	0	0

## (9) Read data from EEPROM (EPMWR) Command: 1; Parameter: None (FDH)

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
<b>Command</b>	0	1	0	1	1	1	1	1	1	0	1

## (10) Display performance adjustment (DISPADJ) Command: 1; Parameter: 1 (FAH)

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	1	1	1	1	1	0	1	0	Display performance adjustment
<b>Parameter1(P1)</b>	1	1	0	*	*	*	P14	P13	P12	P11	P10	Fine tuning level set

ST7626 provide the function of 32 levels fine tuning to adjust best crosstalk performance for each module. Just like Vop offset for different modules, the fine tuning level value can also be stored in EEPROM, and therefore each module can have its individual setup for best display performance.

Due to IC and module process variation, it's hard for all modules to have same display performance. By using this command, different modules can adjust to the best performance by having different parameters of DISPADJ. When loading EEPROM, this individual parameter can be loaded into IC and best display performance can be achieved. Detail using method please refer ST7626 EEPROM User Manual guide.

## (11) Internal Initialize Preparation (IIPP) Command: 1; Parameter: 1 (F4H)

Use this command to set internal initializing for ready status.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
<b>Command</b>	0	1	0	1	1	1	1	0	1	0	0	-
<b>Parameter(P1)</b>	1	1	0	0	1	0	1	1	0	0	0	Internal initialize sequencing

## 8.4 EXT="0" or "1" Function Description

### (1) Extension instruction disable (EXT IN) Command:1 Parameter: None (30H)

Use the "Ext=0" command table

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	1	0	0	0	0

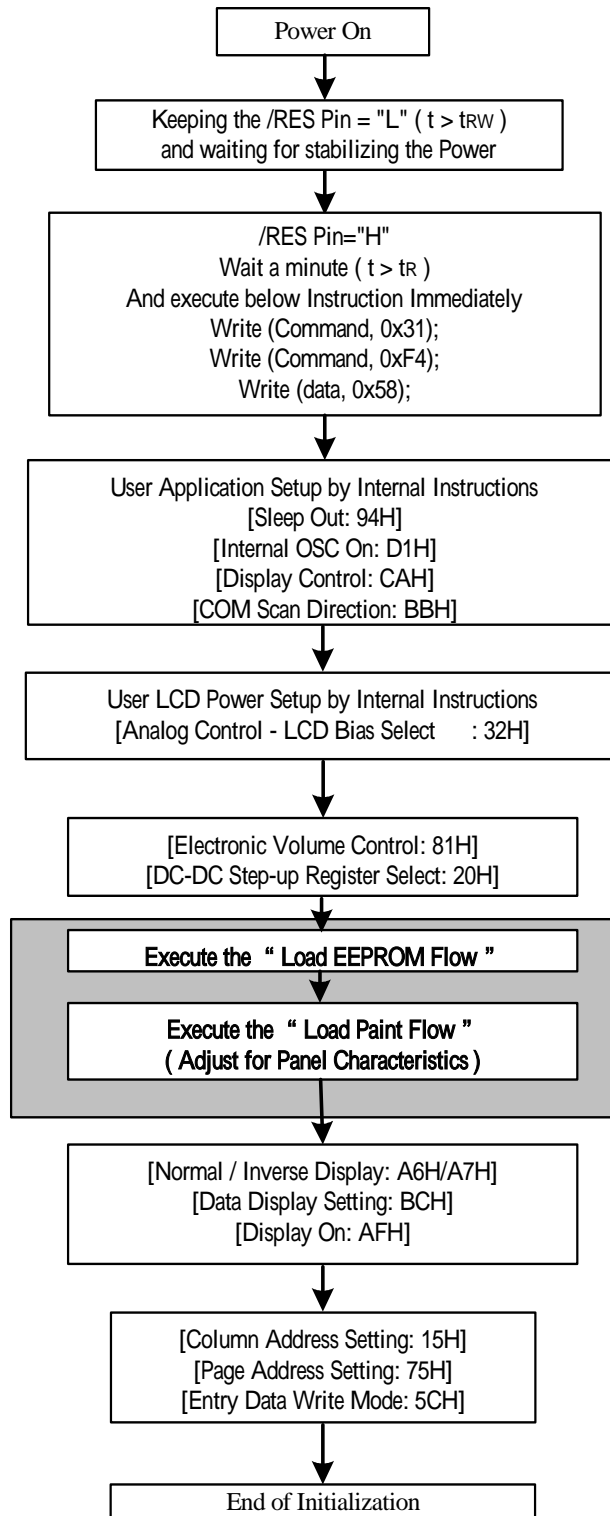

### (2) Extension instruction enable (EXT OUT) Command:1 Parameter: None (31H)

Use the extended command table (EXT="1")

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	1	0	0	0	1

## 8.5 Referential Instruction Setup Flow

### 8.5.1 Initializing with the Built-in Power Supply Circuits

## Example : ST7626 Initial setting for 98X68

```
void ST7626_Init( void )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0x04 );           // Sleep In/Out Preparation
    Write( DATA, 0x3e );            // Sleep In/Out Sequencing

    Write( COMMAND, 0x31 );           // Ext = 1
    Write( COMMAND, 0xf4 );           // Internal Initialize Preparation
    Write( DATA, 0x58 );            // Internal Initialize Sequencing

    Write( COMMAND, 0x30 );           // Ext = 0
    Write( DATA, 0x10 );             // Duty Setting (= 68)
    Write( DATA, 0x00 );            // N-Line Inverse-set value

    Write( COMMAND, 0x31 );           // Ext = 1
    Write( COMMAND, 0x32 );           // Analog Setting
    Write( DATA, 0x00 );            // OSC Frequency adjustment
    Write( DATA, 0x02 );            // Booster Efficiency Setting is level3
    Write( DATA, 0x03 );            // Bias Setting (=1/9)
    Write( DATA, 0x04 );            // Booster is X5

    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0x81 );           // Electronic Volume Control
    Write( DATA, 0x2D );             // EV:Vop[5:0]_6bit
    Write( DATA, 0x02 );            // EV:Vop[8:6]_3bit
    // Vop is 10.52V under this condition for example

    Write( COMMAND, 0x20 );           // Power Control
    Write( DATA, 0x0b );            // B/F/R = On/On/On

    delayms(50);                     // Delay 50ms
    LoadEEPROM()                      // Load EEPROM example program (refer page 68)

    LoadPaint();                      // Load Gamma Table Parameter (refer page 61)

    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0xa7 );           // Inverse Display
    Write( COMMAND, 0xbb );           // Com Scan Direction
    Write( DATA, 0x01 );             // 0~33 / 67~34
    Write( COMMAND, 0xbc );           // Data Scan Direction
    Write( DATA, 0x00 );             // Page / Column Address Setting
    Write( DATA, 0x00 );            // RGB arrangement (0:RGB 1:BGR)
    Write( DATA, 0x01 );            // Gray-scale setup ( 64-gray: 01H)

    Write( COMMAND, 0x75 );           // Page address set
    Write( DATA, 0x00 );             // From page address 0
    Write( DATA, 67 );              // to page address 67
    Write( COMMAND, 0x15 );           // Column address set
    Write( DATA, 0x00 );            // From column address 0
    Write( DATA, 97 );              // to column address 97

    Write( COMMAND, 0xaf );           // Display On
    Write( COMMAND, 0x30 );           // Ext = 0
}
```

## Example : Load EEPROM

```
void LoadEEPROM( void )
```

```
{  
  Write( COMMAND, 0x31 ); // Ext = 1  
  Write( COMMAND, 0xcd ); // Enable EEPROM  
  Write( DATA, 0x00 ); //  
  delaysms(50); // Delay 50ms  
  Write( COMMAND, 0xfd ); // Load EEPROM  
  delaysms(50); // Delay 50ms  
  Write( COMMAND, 0xcc ); // Disable EEPROM  
  Write( COMMAND, 0x30 ); // Ext = 0  
}
```

### 8.5.2 Data Displaying

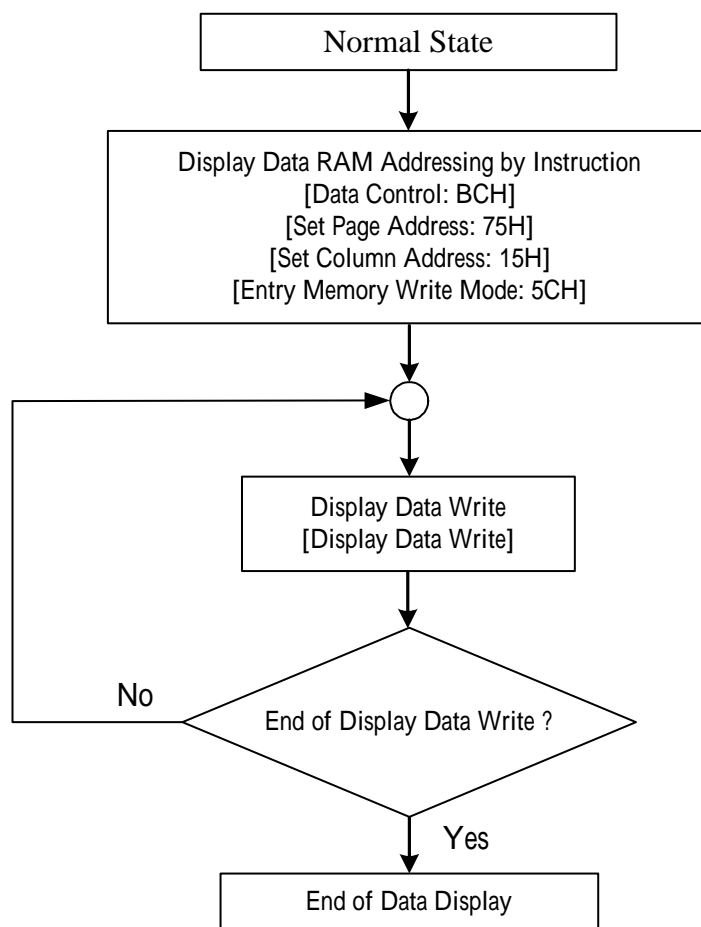

Figure 8.5.2.1 Data Displaying

## Example : Display for 98X68

```

void Display( char *pattern )
{
    unsigned char i, j;

    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0x15 );           // Column address set
    Write( DATA, 0 );                // From column address 0 to 97
    Write( DATA, 97 );
    Write( COMMAND, 0x75 );           // Page address set
    Write( DATA, 0 );                // From page address 0 to 67
    Write( DATA, 67 );
    Write( COMMAND, 0x5c );           // Entry Memory Write Mode
    for( j = 0; j < 68; j++ )
        for( i = 0; i < 98; i++ )
            Write( DATA, pattern[ j ][ i ] ); // Display Data Write
}

```

### 8.5.3 Partial Display In/Out

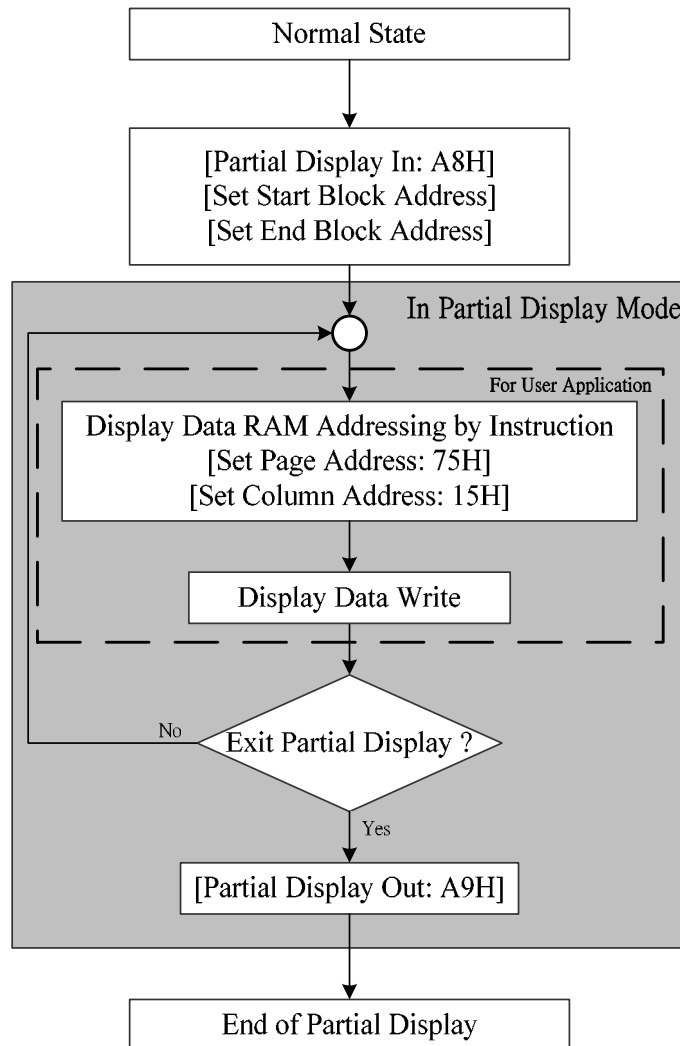

Figure 8.5.3.1 Partial Display In/Out

## Example : Partial Display In Operation

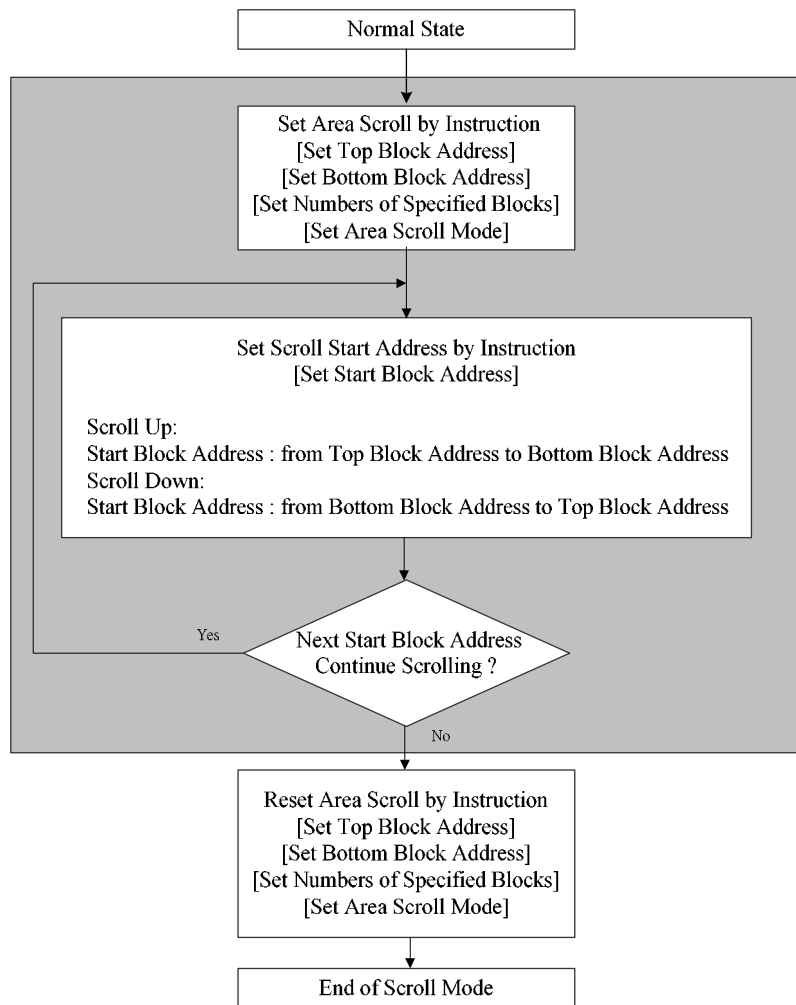

```
void PartailIn( unsigned char start_block, unsigned char end_block )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0xA8);           // Partial Display In Function
    Write( DATA, start_block );     // Start Block
    Write( DATA, end_block );       // End Block
}

void PartailOut( void )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0xA9 );          // Partial Display Out Function
}

void main()
{
    PartialIn( 11, 18 );              // entry partial display mode

    Windowing( 0, 11*4, 131, 18*4 ); // set the page and column range
    PartialDisplay( display_pattern ); // Fill the data into partial display area
    .
    .
    .
    PartialOut();                     // Out of partial display mode
}
```

## 8.5.4 Scroll Display

**Figure 8.5.4.1 Scroll Display**

### Example : Screen Scroll Operation

```

void CenterScreenScroll( void )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0xAA);           // Partial Display In Function
    Write( DATA, 0x0a );             // Top_Block=10
    Write( DATA, 0x14 );             // Bottom_Block=20
    Write( DATA, 0x14 );             // Number of Specified Blocks=Bottom_Block=20
    Write( DATA, 0x00 );             // Area Scroll Type=Center Screen Scroll

    ScrollUp() or ScrollDown();       // Scroll Up or Scroll Down
}

void TopScreenScroll( void )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0xAA);           // Partial Display In Function
    Write( DATA, 0x00 );             // Top_Block=0
    Write( DATA, 0x14 );             // Bottom_Block=20
    Write( DATA, 0x14 );             // Number of Specified Blocks=Bottom_Block=20
    Write( DATA, 0x01 );             // Area Scroll Type=Top Screen Scroll

    ScrollUp() or ScrollDown();       // Scroll Up or Scroll Down
}
  
```

## ST7626

---

```
void BottomScreenScroll( void )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0xAA);           // Partial Display In Function
    Write( DATA, 0x0a );            // Top_Block=10
    Write( DATA, 0x20 );            // Bottom_Block=32
    Write( DATA, 0x20 );            // Number of Specified Blocks=Bottom_Block=32
    Write( DATA, 0x02 );            // Area Scroll Type=Bottom Screen Scroll
    ScrollUp() or ScrollDown();      // Scroll Up or Scroll Down
}
```

```
void WholeScreenScroll( void )
{

    Delay();                          // Delay

    Write( COMMAND, 0x00AB);         // Scroll Start Set
    Write( DATA, Top_Block +2 );    // Start Block Address= Top_Block +2
    Delay();                          // Delay
    .....
    .....
    Write( COMMAND, 0x00AB);         // Scroll Start Set
    Write( DATA, Bottom_Block );    // Start Block Address= Bottom_Block
    Delay();                          // Delay
}
```

```
void ScrollDown( void )
{
    Write( COMMAND, 0x30 );           // Ext = 0
    Write( COMMAND, 0x00AB);         // Scroll Start Set
    Write( DATA, Bottom_Block);     // Start Block Address= Bottom_Block
    Delay();                          // Delay

    Write( COMMAND, 0x00AB);         // Scroll Start Set
    Write( DATA, Bottom_Block -1 ); // Start Block Address= Bottom_Block -1
    Delay();                          // Delay

    Write( COMMAND, 0x00AB);         // Scroll Start Set
    Write( DATA, Bottom_Block -2 ); // Start Block Address= Bottom_Block -2
    Delay();                          // Delay
    .....
    .....
    Write( COMMAND, 0x00AB);         // Scroll Start Set
    Write( DATA, Top_Block );       // Start Block Address= Top_Block
    Delay();                          // Delay
}
```

## 8.5.5 Read-Modify-Write Cycle

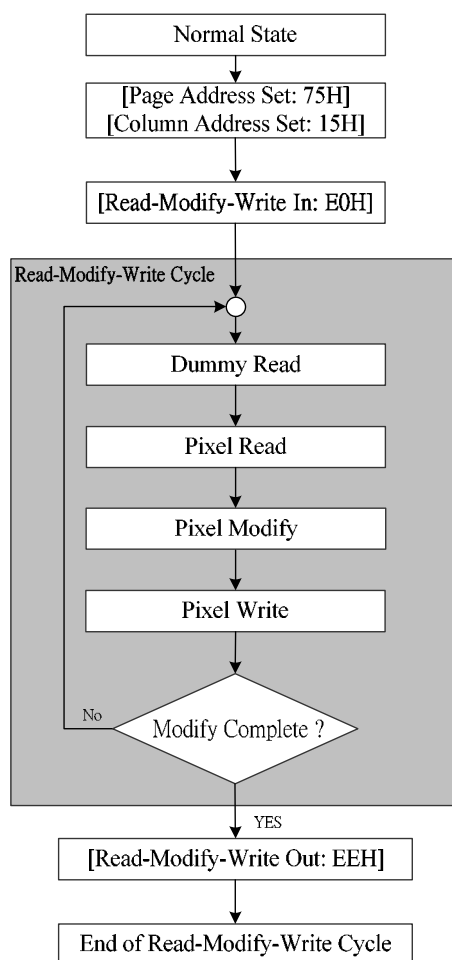

Figure 8.5.5.1 Read-Write-Modify Cycle

### Example : Read-Write-Modify Cycle

```

void ReadModifyWriteIn( void )
{
    Write( COMMAND, 0x30 );    // Ext = 0
    Write( COMMAND, 0xE0 );   // Entry the Read-Modify-Write mode
}
  
```

```

void ReadModifyWriteOut( void )
{
    Write( COMMAND, 0x30 );    // Ext = 0
    Write( COMMAND, 0xEE );   // Out of partial display mode
}
  
```

```

extern unsigned char *display_pattern;
void main()
{
    unsigned pixel, i;

    Windowing( 11, 31, 80, 50 );           // set the page and column range
    ReadModifyWriteIn();                   // entry the Read-Modify-Write mode

    for( i = 0 ; i < 1400 ; i++ )
    {
        Read( DATA );                     // For dummy read
        pixel = Read( DATA );              // Pixel read
        pixel = pixel & 0x07ff;             // Pixel modify: red filter
        Write( DATA, pixel );
    }

    ReadModifyWriteOut();                   // Out of Read-Modify-Write mode
}

```

## 8.5.6 Power OFF Power OFF

Figure 8.5.6.1 Power off

## 8.5.7 Sleep In/Out

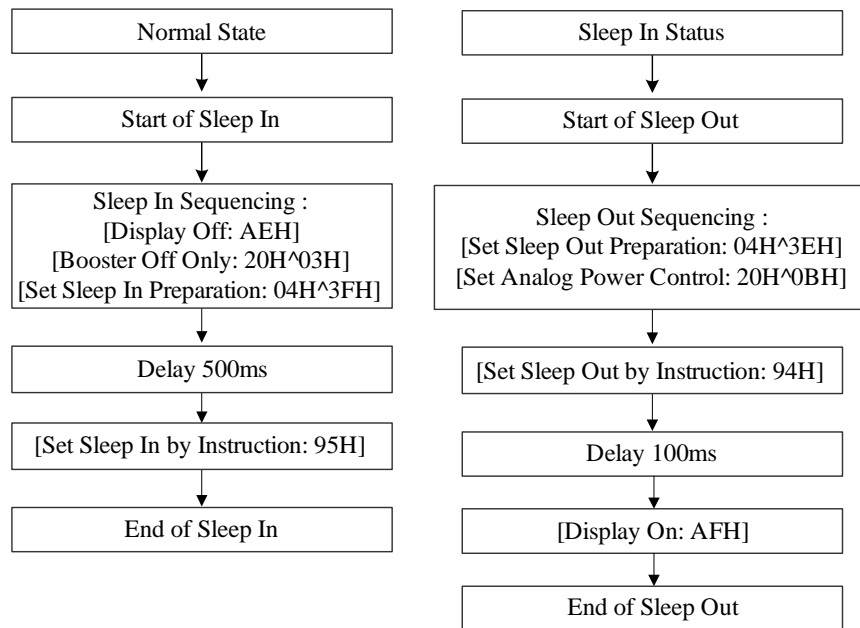

Fig 8.5.7.1 Sleep In/Out Flow

### Example : Sleep In Operation

```
void SleepIn( void )
```

```
{
```

Write( COMMAND, 0x30 );	// Ext = 0
Write( COMMAND, 0xae );	// Display Off
Write( COMMAND, 0x20);	// Power Control
Write( DATA, 0x03 );	// B/F/R = Off/On/On
Write( COMMAND, 0x04 );	// Sleep In Preparation
Write( DATA, 0x3f );	// Sleep In Sequencing
Delay( 500ms);	// Delay 500ms
Write( COMMAND, 0x95 );	// Sleep In

```
}
```

### Example : Sleep Out Operation

```
void SleepOut( void )
```

```
{
```

Write( COMMAND, 0x30 );	// Ext = 0
Write( COMMAND, 0x04 );	// Sleep Out Preparation
Write( DATA, 0x3e );	// Sleep Out Sequencing
Write( COMMAND, 0x20 );	// Power Control
Write( DATA, 0x0b );	// B/F/R = On/On/On
Write( COMMAND, 0x94 );	// Sleep Out
Delay( 100ms );	// Delay 100ms
Write( COMMAND, 0xaf );	// Display On

```
}
```

## 9. LIMITING VALUES

In accordance with the Absolute Maximum Rating System of Bare Die; see notes 1 and 2.

Parameter	Symbol	Conditions	Unit
Power supply voltage	VDD, VDD1~VDD5	-0.5 ~ +4.0	V
Power supply voltage	VLCD <sub>IN</sub>	-0.5 ~ +20	V
Power supply voltage	V1, V2, V3, V4	0.3 to VLCD <sub>IN</sub>	V
Input voltage	V <sub>IN</sub>	-0.5 to VDD+0.5	V
Output voltage	V <sub>O</sub>	-0.5 to VDD+0.5	V
Operating temperature (die)	TOPR	-30 to +85	°C
Storage temperature (die)	TSTR	-40 to +125	°C

### Notes

1. Stresses above those listed under Limiting Values may cause permanent damage to the device.
2. Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V<sub>SS</sub> unless otherwise noted.
3. Insure that the voltage levels of V1, V2, V3, and V4 are always such that

$$VLCD_{IN} > V0 > V1 > V2 > V3 > V4 > VSS$$

## 10. HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see “Handling MOS devices”).

## 11. DC CHARACTERISTICS

$V_{DD} = 1.8\text{ V to }3.3\text{V}$ ;  $V_{SS} = 0\text{ V}$ ;  $V_0 = 3.76\text{ to }18.0\text{V}$ ;  $T_{amb} = -30\text{ to }+85$  ; unless otherwise specified.

Item	Symbol	Condition	Rating			Units	Applicable Pin	
			Min.	Typ.	Max.			
High-level Input Voltage	VIHC		$0.7 \times V_{DD}$	—	VDD	V	*1	
Low-level Input Voltage	VILC		VSS	—	$0.3 \times V_{DD}$	V	*1	
High-level Output Voltage	VOHC		$0.7 \times V_{DD}$	—	VDD	V	*2	
Low-level Output Voltage	VOLC		VSS	—	$0.3 \times V_{DD}$	V	*2	
Input leakage current	ILI	$V_{IN} = V_{DD}$ or $V_{SS}$	-1.0	—	1.0	$\mu\text{A}$	*3	
Output leakage current	ILO	$V_{IN} = V_{DD}$ or $V_{SS}$	-3.0	—	3.0	$\mu\text{A}$	*4	
Liquid Crystal Driver ON Resistance	RON	$T_a = 25^\circ\text{C}$ (Relative To VSS)	$V_{0IN} = 15.0\text{ V}$	—	1	—	K $\Omega$	SEGN COMn *5
			$V_{0IN} = 8.0\text{ V}$	—	1.3	—		
Oscillator Frequency	Internal Oscillator	fOSC	1/68 duty $T_a = 25^\circ\text{C}$ 31 PWM	—	5.39	12.02	kHz	*6
	External Input	fCL		—	167.09	372.62	kHz	OSC
	Frame frequency	fFRAME		Internal OSC: $f_{FRAME} = f_{OSC} / (\text{Duty} + 1)$ External OSC: $f_{FRAME} = f_{CL} / [31 * (\text{Duty} + 1)]$			Hz	

Item	Symbol	Condition	Rating			Units	Applicable Pin	
			Min.	Typ.	Max.			
Internal Power	Operating Voltage (1)	VDD VDD1	(Relative to VSS)	1.7	—	3.4	V	VSS*7
	Operating Voltage (2)	VDD2 VDD3 VDD4 VDD5	(Relative to VSS)	2.4	—	3.4	V	VSS
	Supply Step-up output voltage Circuit	VLCD <sub>OUT</sub>	(Relative To VSS)	—	—	20	V	VLCD <sub>OUT</sub>
	Voltage regulator Circuit Operating Voltage	VLCD <sub>IN</sub>	(Relative To VSS)	—	—	20	V	VLCD <sub>IN</sub>

Dynamic Consumption Current : During Display, with the Internal Power Supply OFF Current consumed by total ICs when an external power supply is used .

Test pattern	Symbol	Condition	Rating			Units	Notes
			Min.	Typ.	Max.		
Display Pattern Normal(Bare die)	ISS	Bare Die, VDD = 2.8 V, Booster x 5 @ 1/9 bias, 1/68 duty, Vop=11V	—	350	—	μA	*8
Power Down (Bare die)	ISS	Ta = 25°C	—	—	10	μA	

### Notes to the DC characteristics

1. The maximum possible  $V_{LCD}$  voltage that may be generated is dependent on voltage, temperature and (display) load Internal clock.
2. Power-down mode. During power down all static currents are switched off.
3. If external VLCD, the display load current is not transmitted to  $I_{DD}$ .
4. VLCD external voltage applied to  $VLCD_{IN}$  pin;  $VLCD_{IN}$  disconnected from  $VLCD_{OUT}$

### References for items market with \*

- \*1 The A0, D0 to D5, D6, D7, SI, SCL, E\_RD, RW\_WR, /CS, RST terminals.
- \*2 The D0 to D7.
- \*3 The A0, E\_RD, RW\_WR, /CS, RST terminals.
- \*4 Applies when the D0 to D5, D6, D7, SI, SCL, terminals are in a high impedance state.
- \*5 These are the resistance values for when a  $0.2 \times V_0$  voltage is applied between the output terminal  $SEGN$  or  $COMn$  and the various power supply terminals ( $V_1$ ,  $V_2$ ,  $V_3$ , and  $V_4$ ). These are specified for the operating voltage range.  
 $RON = (0.2 V_0) / \Delta I$  (Where  $\Delta I$  is the current that flows when  $0.2 V_0$  is applied while the power supply is ON.)
- \*6 The relationship between the oscillator frequency and the frame rate frequency under CL dividing ratio setting = 00H.
- \*7 While a broad range of operating voltages is guaranteed, performance cannot be guaranteed if there are sudden fluctuations to the voltage while the MPU is being accessed.
- \*8 It indicates the current consumed on ICs alone when the internal oscillator circuit and display are turned on.

## 12. TIMING CHARACTERISTICS

### System Bus Read/Write Characteristics 1 (For the 8080 Series MPU)

CS-SCL time		tCSH		80	—	

\*1 The input signal rise and fall time ( $t_r, t_f$ ) are specified at 15 ns or less.

\*2 All timing is specified using 20% and 80% of  $V_{DD}$  as the standard.

### Serial Interface Characteristics (For 3-Line Interface)

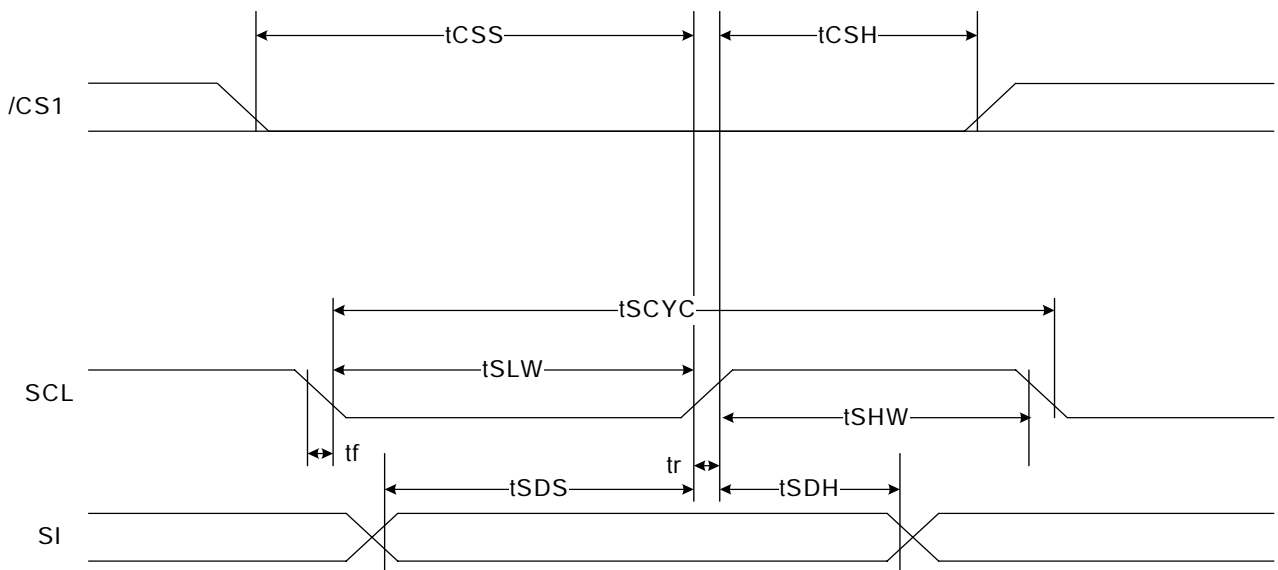

Fig 12.4

(V<sub>DD</sub>=3.3V, T<sub>a</sub>= -30 to 85°C )

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial clock period	SCL	tSCYC		80	—	ns
SCL "H" pulse width		tSHW		40	—	
SCL "L" pulse width		tSLW		40	—	
Data setup time	SI	tSDS		10	—	
Data hold time		tSDH		30	—	
CS-SCL setup time	/CS	tCSS		20	—	
CS-SCL hold time		tCSH		50	—	

(V<sub>DD</sub>=2.8V, T<sub>a</sub>= -30 to 85°C )

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial clock period	SCL	tSCYC		100	—	ns
SCL "H" pulse width		tSHW		50	—	
SCL "L" pulse width		tSLW		50	—	
Data setup time	SI	tSDS		10	—	
Data hold time		tSDH		30	—	
CS-SCL time	/CS	tCSS		20	—	
CS-SCL time		tCSH		50	—	

(V<sub>DD</sub>=1.8V, T<sub>a</sub>= -30 to 85°C )

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial clock period	SCL	tSCYC		180	—	ns
SCL "H" pulse width		tSHW		90	—	
SCL "L" pulse width		tSLW		90	—	
Data setup time	SI	tSDS		10	—	
Data hold time		tSDH		45	—	
CS-SCL time	/CS	tCSS		10	—	
CS-SCL time		tCSH		80	—	

\*1 The input signal rise and fall time (tr, tf) are specified at 15 ns or less.

\*2 All timing is specified using 20% and 80% of V<sub>DD</sub> as the standard.

13. RESET TIMING

Fig 13.1

(VDD = 3.3V , Ta = -30 to 85°C )

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	1	us
Reset "L" pulse width	RESB	tRW		1.2	—	—	us

(VDD = 2.8V , Ta = -30 to 85°C )

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	1.5	us
Reset "L" pulse width	RESB	tRW		1.5	—	—	us

(VDD = 1.8V , Ta = -30 to 85°C )

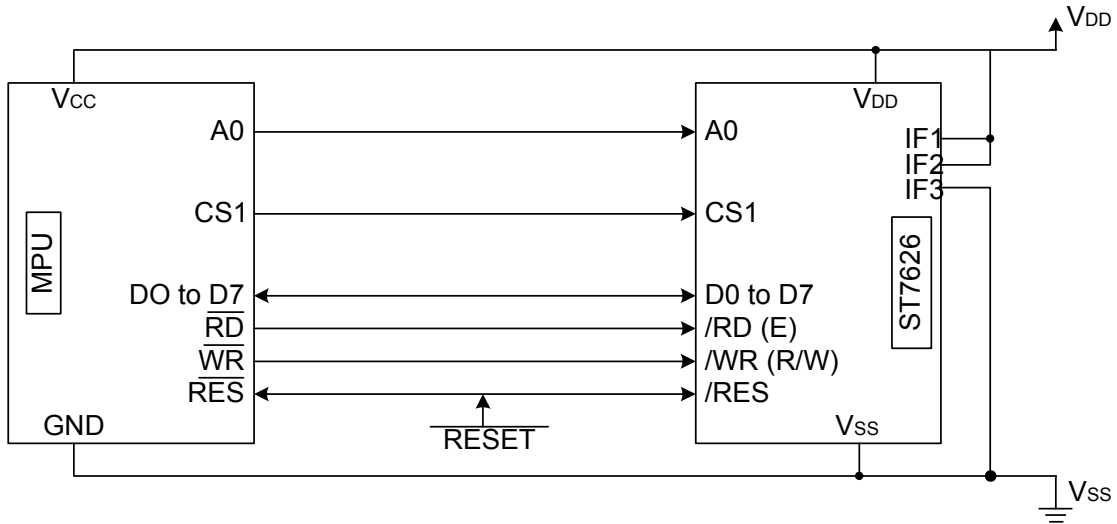

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR		—	—	2	us
Reset "L" pulse width	RESB	tRW		2	—	—	us

## 14. THE MPU INTERFACE (REFERENCE EXAMPLES)

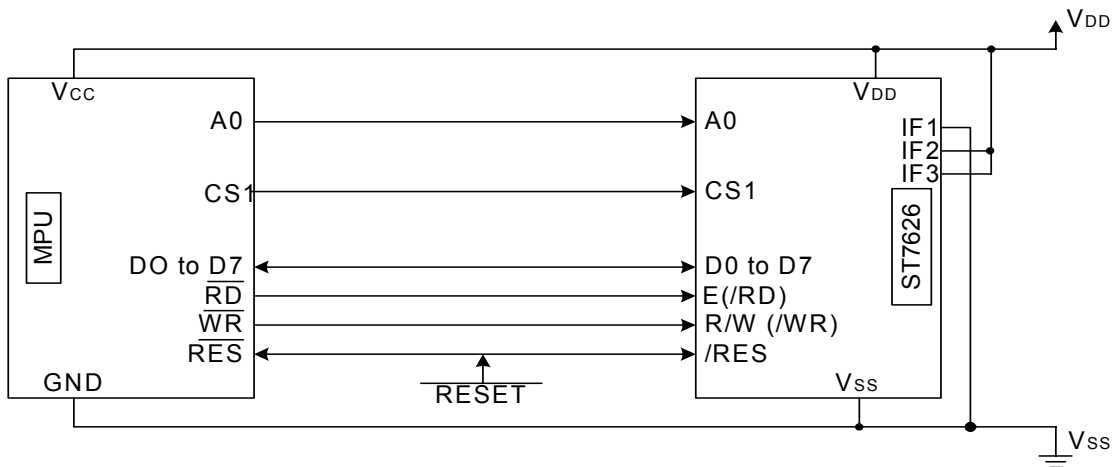

The ST7626 Series can be connected to either 8080 Series MPUs or to 6800 Series MPUs. Moreover, using the serial interface it is possible to operate the ST7626 series chips with fewer signal lines.

The display area can be enlarged by using multiple ST7626 Series chips. When this is done, the chip select signal can be used to select the individual lcs to access.

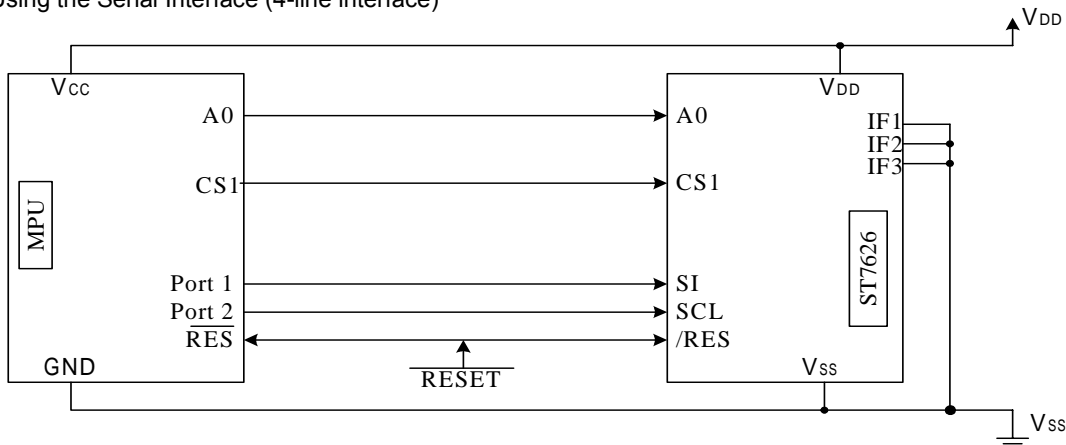

### (1) 8080 Series MPUs

### (2) 6800 Series MPUs

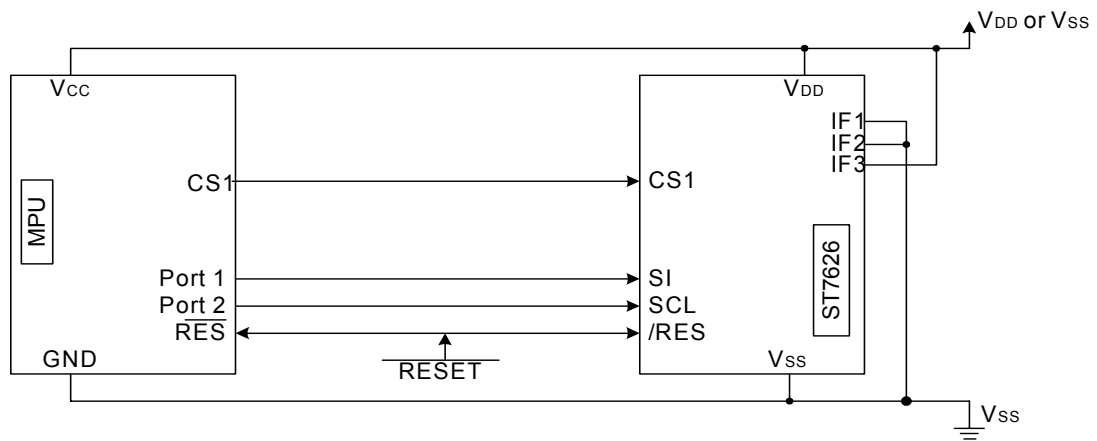

### (3) Using the Serial Interface (4-line interface)

# ST7626

(4) Using the Serial Interface (3-line interface)

## Application Circuits

( A ) 80 Series 16-bit Parallel Interface:

Interface : 8080series-16bits  
VDD1(VDD,VDD1)=1.8~3.3V  
VDD2(VDD2~VDD5)=2.4~3.3V  
CSEL=H (Interlace Mode)  
IF1=H;IF2=H;IF3=H  
C0: 1.0~2.2uF/25V

## ( B ) 80 Series 8-bit Parallel Interface:

Interface : 8080series-8bits  
VDD1(VDD,VDD1)=1.8~3.3V  
VDD2(VDD2~VDD5)=2.4~3.3V  
CSEL=H (Interlace Mode)  
IF1=H;IF2=H;IF3=L  
C0: 1.0~2.2uF/25V

## ( C ) 3 Line Serial Peripheral Interface:

Interface : 9-bit Serial(3-Line)  
VDD1(VDD,VDD1)=1.8~3.3V  
VDD2(VDD2~VDD5)=2.4~3.3V  
CSEL=H (Interlace Mode)  
IF1=L;IF2=L;IF3=H  
C0: 1.0~2.2uF/25V

## ( D ) 4 Line Serial Peripheral Interface:

Interface : 8-bit Serial(4-Line)  
VDD1(VDD,VDD1)=1.8~3.3V  
VDD2(VDD2~VDD5)=2.4~3.3V  
CSEL=H (Interlace Mode)  
IF1=L;IF2=L;IF3=L  
C0: 1.0~2.2uF/25V

## 16. Application Note of VLCD and Vop (V0) ITO Layout

When using internal voltage generator, VLCDIN, VLCDOUT must be connected together. V0IN and V0OUT must be connected together too. In the following is the ITO layout for VLCDIN, VLCDOUT, V0IN and V0OUT individually. Please follow the way as below for these two LCD power voltages.

**NOTE:**

*Microprocessor interfece pins should not be floating in any operation mode.*

<b>ST7626 Serial Specification Revision History</b>		
<b>Version</b>	<b>Date</b>	<b>Description</b>
0.x	--	Preliminary version
1.0	2006/04/10	First issue.
1.1	2006/5/23	Change the limitation voltage (P77): VDD, VDD1=1.7V~3.4V VDD2, VDD3, VDD4, VDD5=2.4V~3.4V
1.2	2006/7/23	Change write EEPROM example program ( P.43) Add microprossoer notice item (P.13,P93)
1.3	2006/09/25	Add Vref Pin notice item (P.14,P11) Modify Application circuit vref Pin section (P89, P90,P91,P92 )
1.4	2006/10/31	Modify page 67: ST7626 initial code example program
1.5	2007/01/20	Modify page application circuit : page 89~page 93
