

**EL Series**

**CHIP TYPE, LONG LIFE ASSURANCE**

- Wide temperature range -55°C to +105°C
- Load life of 2000~3000 hours
- Comply with the RoHS directive (2002/95/EC)

**SPECIFICATIONS**

Items	Characteristics															
Operation Temperature Range	-55 ~ +105°C															
Rated Working Voltage	6.3 ~ 50V															
Capacitance Tolerance	±20% at 120Hz, 20°C															
Leakage Current	$I \leq 0.01CV$ or $3\mu A$ whichever is greater (after 2 minutes) I: Leakage current ( $\mu A$ ) C: Normal capacitance ( $\mu F$ ) V: Rated voltage (V)															
Dissipation Factor max.	Measurement frequency: 120Hz, Temperature: 20°C															
	<table border="1"> <thead> <tr> <th>WV</th> <th>6.3</th> <th>10</th> <th>16</th> <th>25</th> <th>35</th> <th>50</th> </tr> </thead> <tbody> <tr> <td><math>\tan \delta</math></td> <td>0.28</td> <td>0.24</td> <td>0.20</td> <td>0.16</td> <td>0.13</td> <td>0.12</td> </tr> </tbody> </table>	WV	6.3	10	16	25	35	50	$\tan \delta$	0.28	0.24	0.20	0.16	0.13	0.12

Impedance ratio ZT/Z20 (max.)	Z(-25°C)/Z(20°C)	6.3	10	16	25	35	50									
Z(-40°C)/Z(20°C)		8	5	4	3	3	3									
Load Life (After 3000 hours (2000 hours for $\varnothing 4 \sim \varnothing 6.3$ ) application of the rated voltage at 105°C, capacitors meet the characteristics requirements listed.)	Capacitance Change	Within ±25% of initial value														
	Dissipation Factor	200% or less of initial specified value														
	Leakage Current	Initial specified value or less														
Shelf Life (at 105°C)	After leaving capacitors under no load at 105°C for 1000 hours, they meet the specified value for load life characteristics listed above.															
Resistance to Soldering Heat	After reflow soldering according to Reflow Soldering Condition (see page 8) and restored at room temperature, they meet the characteristics requirements listed as below.															
	Capacitance Change	Within ±10% of initial value														
	Leakage Current	Initial specified value or less														
Reference Standard	JIS C-5141 and JIS C-5102

## SERIES CHART

### ● Chip Type Aluminum Electrolytic Capacitors

## GENERAL INFORMATION FOR APPLICATION

The following precautions must be observed when using electrolytic capacitors.

### 1. Circuit Design

- 1) Please make sure that the environmental and mounting conditions to which the capacitor to be exposed are within the conditions specified in this catalogue.
- 2) Operating temperature and applied ripple must be within the specifications.
- 3) Appropriate capacitors, which comply with the life requirement of the products, should be selected when designing the circuit.
- 4) Aluminum electrolytic capacitors are polarized. Do not apply reserve voltage or AC voltage. Please use non-polarized capacitors for a circuit that can possibly see reserved polarity.  
Note: Non-polarizes capacitors cannot be used for AC voltage application.
- 5) Do not use aluminum electrolytic capacitors in a circuit that requires rapid and very frequent charge or discharge. In this type of circuit, it is necessary to use special design capacitors with extended life characteristics.
- 6) Do not apply excess voltage.
  - ① Pleasd pay attention so that the peak voltage, which is DC voltage overlapped by ripple current, should not exceed the rated voltage.
  - ② In the case where more than two aluminum electrolytic capacitors are used in series, please make sure that applied voltage should be lower than rated voltage should be applied to each capacitor equally using a balancing resistor in parallel with the capacitor.
- 7) Outer sleeved of the capacitor is not guarantee as an electrical insulator. Do not use standard sleeve on a capacitor in applications that require electrical insulation. When the application requires special insulation, please contact our sales office for details.
- 8) Capacitors must not be used under following conditions:
  - ① (a) Capacitors must not be exposed to water (including condensation), brine or oil.  
(b) Ambient conditions that include toxic gases such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine, ammonium, etc.  
(c) Ambient conditions that expose the capacitor to ozone, ultraviolet ray and radiation.
  - ② Severe vibration and physical shock conditions that exceed our specification.  
Vibration test condition:  
Vibration frequency range: 10~55~10Hz  
Sweet rate : 10~55~10Hz per minute  
Sweet method : logarithmic  
Amplitude or acceleration: 1.5 (max. acceleration is 10G)  
Direction of vibration : X, Y, Z direction  
Testing time : 2 hours per each direction

Shock is not applicable normally.

If a particular condition is required, please contact our sales office.

- 9) When designing a circuit board, please pay attention to the following:
  - ① Make the pad spacing on the PC board matching with the lead space of the capacitor.
  - ② There should not be any circuit pattern or circuit wire above the capacitor safety vent.
- 10) The main chemical solution of the electrolyte and the separator paper in the capacitor are combustible. The electrolyte is conductive. When it comes in contact with the PC board, there is a possibility of pattern or short circuit between the circuit pattern, which could result in smoking or fire. Do not locate any circuit pattern beneath the capacitor end seal.
- 11) Do not design a circuit board so that heat generating components are placed near an aluminum electrolytic capacitor or reserve side of PC board (under the capacitor).
- 12) Please refer to the pad size layout recommendations in our catalogue when designing in surface mount capacitors.
- 13) Electrical characteristics may vary depending on changes in temperature and frequency. Please consider the variation when you design circuits.
- 14) When you install more than 2 capacitors in parallel, consider the balance of current following in to the capacitor.

## 2. Mounting

- 1) Once a capacitor has been assembled in the set and power applied, do not attempt to re-use the capacitor in other circuits or application.
- 2) Electric potential between positive and negative terminal may exist as a result of returned electromotive force, so please discharge the capacitor using 1K $\Omega$  resistor.
- 3) Leakage current of the parts that have stored for long period may increase. When leakage current has increased, please perform a voltage treatment using a 1K $\Omega$  resistor.
- 4) Please confirm rating and polarity before installing capacitor on the PC board.
- 5) Be careful not to deform the capacitor during installation.
- 6) Please confirm that the lead spacing of the capacitor matches the pad spacing of the PC board prior to installation.
- 7) Please pay attention to the mechanical shock to the capacitor by suction nozzle of the automatic insertion machine or automatic mounted, or by product checker, or by centering mechanism.
- 8) Reflow soldering: Please see "Lead Free Reflow Soldering Condition" for chip type aluminum electrolytic capacitors (page 8).
- 9) Do not tilt, lay down or twist the capacitor body after the capacitors are soldered to the PC board.
- 10) Do not carry the PC board by grasping the soldered capacitor.
- 11) Please do not allow anytime to touch the capacitor after soldering. If PC board are stored in stack, please make sure PC board or the other components do not touch the capacitor. The capacitor shall not be effected by any radiated heat from the soldered PC board or other components after soldering.
- 12) Cleaning
  - ① Do not clean capacitors with halogenated cleaning agent. However, if it is necessary to clean with halogenated cleaning agent, please contact our sales office.
  - ② Recommended cleaning method:  
Applicable : Any type, any ratings  
Cleaning agents : Pine Alpha ST-100S, cleaning through 750H/750L/710M, Sanelek B-12, Aqua Cleaner 210SEP, Techno Care FRW14~17, Isopropyl Alcohol.

Cleaning condition: Total cleaning time shall be within 5 minutes by immersion, ultrasonic or other method. Temperature of the cleaning agent shall be 60°C or lower. After cleaning, capacitors should be dried using hot air for minimum of 10 minutes along with the PC board. Hot air temperature should be below the maximum operating temperature of the capacitor. Insufficient dry after water rinse may cause appearance problems, sleeve shirk, bottom- plate bulge and such.

- ③ Avoid using ozone destructive substance for cleaning agents to concern about global environment. Please consult us regarding other cleaning agents or cleaning methods.

### 3. In The Equipment

- 1) Do not directly touch terminal by hand.
- 2) Do not short between terminal by conductor, nor spill conductible liquid such as alkaline or acidic solution on or near the capacitor.
- 3) Please make sure that the ambient conditions where the set is installed will be free from spilling water or oil, direct sunlight, ultraviolet rays, radiation, poisonous gases, vibration or mechanical shock.

### 4. Maintenance and Inspection

Please periodically inspect the aluminum capacitors that are installed in industrial equipment. The following items should be checked:

Appearance: Remarkable abnormality such as vent operation, leaking electrolyte etc.

Electrical characteristic: Capacitance, dielectric loss tangent, leakage current etc., which are specified in this catalogue.

### 5. In an Emergency

- 1) If you see smoke due to operation of safety vent, turn off the main switch or pull out the plug from the outlet.
- 2) Do not draw your face to the safety vent since gas over 100°C will be emitted when the safety vent operates. If the gas has entered your eyes, please flush your eyes immediately in pure water. If you breathed the gas immediately wash out your mouth and throat with water. Do not ingest electrolyte. If your skin is exposed to electrolyte, please wash it away using soap and water.

### 6. Storage

- 1) Do not keep capacitor in high temperature and high humidity.

Storage conditions should be:

Temperature : +5°C ~ +35°C

Humidity : Lower than 75%

Place : Indoor

- 2) Avoid ambient conditions where capacitors can be covered with water, brine or oil.
- 3) Avoid ambient conditions where capacitors are exposed to poisonous gases such as hydrogen sulfide, sulfurous acid, nitrous acid, chlorine, ammonium etc.
- 4) Do not keep capacitor in conditions that expose the capacitor to ozone, ultraviolet ray or radiation.

### 7. Disposal

Please dispose capacitors in either of the following ways:

- 1) Incinerate capacitors after crushing parts or making a hole on the capacitor body.
- 2) Bury capacitors in the ground. Please have a disposal specialist do it.

## LEAD FREE REFLOW SOLDERING CONDITION

(Applicable to Chip Type Aluminum Electrolytic Capacitors)

### Recommended Conditions for Reflow Soldering

- (1) A thermal condition system such as infrared radiation (IR) or hot blast should be adopted, and vapor heat transfer systems (VPS) are not recommended.
- (2) Reflow soldering should be performed one time. If the capacitor has to be reflowed twice, 30 minutes must be layout between each time.
- (3) For lead-free type reflow soldering, please observe proper conditions below:
  - a) The time of preheating from 150°C to 200°C shall be within maximum 180 seconds;
  - b) The time of soldering temperature at 217°C measured on capacitors' top shall not exceed  $t_L$  (second);
  - c) The peak temperature on capacitors' top shall not exceed  $T_p$ (°C), and the time within 5°C of actual peak temperature shall not exceed  $t_p$  (second).

### Classification Reflow Profile

\*1. Average ramp-up rate is 3°C/second max.

\*2. Ramp-down rate is 6°C/second max.

\*3. Time from 25°C to peak temperature is 8 minutes max.

### Allowable Range of Peak Temperature

Size	Thickness (mm)	Volume (mm <sup>3</sup> )	$T_p$ (°C)	$t_L$ (second)	$t_p$ (second)
Ø4~Ø6.3, Ø8×6.2L	≥2.5	<350	250±0	90	5
Ø8×10.5L	≥2.5	350~2000	240±0	90	5
Ø10×10.5L/13.5L	≥2.5	350~2000	235±0	60	5
Ø12.5, Ø16	≥2.5	>2000	230±0	30 (20*)	5

Re: (20\*) is special for mid-to-high voltage which is HU series.

### Recommended Land Size (Unit: mm)

Size	a	b	c
Ø4	1.6	2.6	1.6
Ø5	1.6	3.0	1.6
Ø6.3	1.6	3.5	1.6
Ø8×6.2L	2.1	4.5	1.6
Ø8×10.5L	3.0	3.5	2.5
Ø10	4.0	4.0	2.5
Ø12.5	4.0	5.7	3.0
Ø16×16.5/21.5	6.0	6.5	3.5

## LIFE OF ALUMINUM ELECTROLYTIC CAPACITORS

The life of aluminum electrolytic capacitors is mainly dependent on environmental conditions (e.g. ambient temperature, humidity etc.) and electrical factors (e.g. operating temperature, ripple current etc.) Generally, the wear-out mechanism of aluminum electrolytic capacitors is based on evaporation of electrolyte through the rubber seal. Consequently, the factor of temperature (ambient temperature and internal heating due to ripple current) is the most critical to electrolytic capacitors life. The effect of voltage on capacitor life is negligible, especially for low voltage electrolytic capacitors. The lifetime of aluminum electrolytic capacitors can be expressed as following equations:

$$L_e = L_o \cdot K_t \cdot K_r \quad \text{----- (1)}$$

Where:

$L_e$  = Expected life at operating temperature  $T_e$  (h)

$L_o$  = Specified life at temperature operating temperature  $T_o$  (h)

$K_t$  = Ambient temperature acceleration term

$K_r$  = Ripple current acceleration term

$$K_t = L_o \cdot A^{(T_o - T_e)/10} \quad \text{----- (2)}$$

Where:

$T_o$  = Maximum rated operating temperature (°C)

$T_e$  = Actual ambient temperature (°C)

$A$  = Acceleration coefficient (for the range from 35°C to the maximum operating temperature,  $A \approx 2$ )

$$K_r = 2^{(-\Delta T/5)} \quad \text{----- (3)}$$

Where:

$\Delta T$  = An increase in core temperature by internal heating due to ripple current

( $\Delta T$  = core temperature – ambient temperature)

$\Delta T$  can be estimated as follows:

$$\Delta T = (I^2 \cdot R) / (\beta \cdot S) \quad \text{----- (4)}$$

Where:

$I$  = Ripple current of the capacitor (A rms)

$R$  = Equivalent series resistance of the capacitor ( $\Omega$ )

$\beta$  = Heat radiation coefficient of the aluminum can ( $W/^\circ C \cdot cm^2$ )

$S$  = Surface area of the capacitor ( $cm^2$ )
