

## Features

- Fully Integrated Fractional-N PLL
- ASK and Closed Loop FSK Modulation
- Output Power Up to +12.5dBm from 300MHz to 450MHz
- Current Consumption is Scaled by Output Power Programming
- Fast Crystal Oscillator Start-up Time of Typically 200 $\mu$ s
- Low Current Consumption of Typically 7.3mA at 5.5dBm
- Only One 13.0000MHz Crystal for 314.1MHz to 329.5MHz and 424.5MHz to 439.9MHz Operation
- Single Ended RF Power Amplifier Output
- Many Software Programmable Options Using SPI:
  - Output Power from –0.5dBm to +12.5dBm
  - RF Frequency from 300MHz to 450MHz with Different Crystals
  - FSK Deviation with 396Hz Resolution
  - CLK Output Frequency 3.25MHz or 1.625MHz
- Data Rate Up to 40kbit/s (Manchester)
- 4KV HBM ESD Protection Including XTO
- Operating Temperature Range of –40°C to +125°C
- Supply Voltage Range of 1.9V to 3.6V
- TSSOP10 Package

## Benefits

- Robust Crystal Oscillator with Fast Start Up and High Reliability
- Lower Inventory Costs and Reduced Part Number Proliferation
- Longer Battery Lifetime
- Supports Multi-channel Operation
- Wide Tolerance Crystal Possible with PLL Software Compensation

## 1. Description

The Atmel<sup>®</sup> ATA5749 is a fractional-N-PLL transmitter IC for 300MHz to 450MHz operation and is especially targeted for Tire Pressure Sensor Gauges, Remote Keyless Entry, and Passive Entry and other automotive applications. It operates at data rates up to 40kbit/s Manchester for ASK and FSK with a typical 5.5dBm output power at 7.3mA. Transmitter parameters such as output power, output frequency, FSK deviation, and current consumption can be programmed using the SPI interface. This fully integrated PLL transmitter IC simplifies RF board design and results in very low material costs.

Table 2-1. Pin Description

| Pin | Symbol     | Function                                |
|-----|------------|---|
| 1   | CLK        | CLK output                              |
| 2   | SDIN_TXDIN | Serial bus data input and TX data input |
| 3   | SCK        | Serial bus clock input                  |
| 4   | ANT2       | Antenna interface                       |
| 5   | ANT1       | Antenna interface                       |
| 6   | XTO2       | Crystal/C <sub>LOAD2</sub> connection   |
| 7   | XTO1       | Crystal/C <sub>LOAD1</sub> connection   |
| 8   | VS         | Supply input                            |
| 9   | GND        | Supply GND                              |
| 10  | EN         | Enable input                            |

### 3. Functional Description

#### 3.1 Fractional-N PLL

The Atmel® ATA5749 block diagram is shown in [Figure 1-1 on page 2](#). The operation of the PLL is determined by the contents of a 32-bit configuration register. The 15-bit value `FREQ` is used with the 1-bit `S434_N315` flag to determine the RF carrier frequency. This results in a user-selectable frequency step size of 793Hz (with 13.000MHz crystal). With this level of resolution, it is possible to compensate for crystal tolerance by adjusting the value of `FREQ` accordingly. This enables the use of lower cost crystals without compromising final accuracy. In addition, software programming of RF carrier frequency allows this device to be used in some multi-channel applications.

Modulation type is selected with the 1-bit `ASK_NFSK` flag. FSK modulation is achieved by modifying the divider block in the feedback loop. The benefit to this approach is that performance-reducing RF spurs (common in applications that create FSK by “pulling” the load capacitance in the crystal oscillator circuit) are completely eliminated. The 8-bit value `FSEP` establishes the FSK frequency deviation. It is possible to obtain FSK frequency deviations from  $\pm 396\text{Hz}$  to  $\pm 101\text{kHz}$  in steps of  $\pm 396\text{Hz}$ .

The PLL lock time is  $1280/(\text{external crystal frequency})$  and amounts to  $98.46\mu\text{s}$  when using a 13.000MHz crystal. When added to the crystal oscillator start-up time, a very fast time-to-transmit is possible (typically  $300\mu\text{s}$ ). This feature extends battery life in applications like Tire Pressure Monitoring Systems, where the message length is often shorter than 10ms and the time “wasted” during start-up and settling time becomes more significant.

#### 3.2 Selecting the RF Carrier Frequency

The fractional divider can be programmed to generate an RF output frequency  $f_{\text{RF}}$  according to the formulas shown in [Table 3-1](#). Note that in the case of  $f_{\text{RF ASK}}$ , the `FSEP/2` value is rounded down to the next integer value if `FSEP` is an odd number.

**Table 3-1.** RF Output Parameter Formulas

| RF Output Parameter        | S434_N315 = LOW  | S434_N315 = HIGH   |
|----------------------------|--|--|
| $f_{\text{RF\_FSK\_LOW}}$  | $(24 + (\text{FREQ} + 0.5)/16384) \times f_{\text{XTO}}$                 | $(32.5 + (\text{FREQ} + 0.5)/16384) \times f_{\text{XTO}}$                 |
| $f_{\text{RF\_FSK\_HIGH}}$ | $(24 + (\text{FREQ} + \text{FSEP} + 0.5)/16384) \times f_{\text{XTO}}$   | $(32.5 + (\text{FREQ} + \text{FSEP} + 0.5)/16384) \times f_{\text{XTO}}$   |
| $f_{\text{DEV\_FSK}}$      | $\text{FSEP}/32768 \times f_{\text{XTO}}$                                | $\text{FSEP}/32768 \times f_{\text{XTO}}$                                  |
| $f_{\text{RF ASK}}$        | $(24 + (\text{FREQ} + \text{FSEP}/2 + 0.5)/16384) \times f_{\text{XTO}}$ | $(32.5 + (\text{FREQ} + \text{FSEP}/2 + 0.5)/16384) \times f_{\text{XTO}}$ |

`FSEP` can take on the values of 1 to 255. Using a 13.000MHz crystal, the range of frequency deviation  $f_{\text{DEV\_FSK}}$  is programmable from  $\pm 396\text{Hz}$  to  $\pm 101.16\text{kHz}$  in steps of  $\pm 396\text{Hz}$ . For example, with `FSEP` = 100 the output frequency is FSK modulated with  $f_{\text{DEV\_FSK}} = \pm 39.6\text{kHz}$ .

`FREQ` can take values in the range of values 2500 and 22000. Using a 13.000MHz crystal, the output frequency  $f_{\text{RF}}$  can be programmed to 315MHz by setting `FREQ[0:14]` = 3730, `FSEP[0:7]` = 100 and `S434_N315` = 0. By setting `FREQ[0:14]` = 14342, `FSEP[0:7]` = 100 and `S434_N315` = 1, 433.92MHz can be realized.

The PA is enabled when the PLL is locked and the configuration register programming is completed. Upon enabling PA at FSK-mode, the RF output power will be switched on. At ASK mode, the input signal must be additionally set high for RF at output pins. The output power is user programmable from  $-0.5\text{dBm}$  to  $+12.5\text{dBm}$  in steps of approximately 1dB. Changing the output power requirements, you also modify the current consumption. This gives the user the option to optimize system performance (RF link budget versus battery life). The PA is implemented as a Class-C amplifier, which uses an open-collector output to deliver a current pulse that is nearly independent from supply voltage and temperature. The working principle is shown in [Figure 3-1](#).

**Figure 3-1.** Class C Power Amplifier Output

The peak value of this current pulse  $I_{\text{Pulse}}$  is calibrated during Atmel® ATA5749 production to about  $\pm 20\%$ , which corresponds to about 1.5dB variation in output power for a given power setting under typical conditions. The actual value of  $I_{\text{Pulse}}$  can be programmed with the 4-bit value in PWR. This allows the user to scale both the output power and current consumption to optimal levels.

ASK modulation is achieved by using the SDIN\_TXDIN signal where a HIGH on this pin corresponds to RF carrier “ON” and a LOW corresponds to RF “OFF”. FSK uses the same signal path but HIGH switch on the upper FSK-frequency.

### 3.3 Crystal Oscillator

The crystal oscillator (XTO) is an amplitude-regulated Pierce oscillator. It has fixed function and is not programmable. The oscillator is enabled when the EN is “set”. After the oscillator’s output amplitude reaches an acceptable level, the XTO\_RDY flag is “set”. The CLK-pin becomes active if CLK\_ON is set. The PLL receives its reference frequency.

Typically, this process takes about 200 $\mu$ s when using a small sized crystal with a motional capacitance of 4fF. This start-up time strongly depends on the motional capacitance of the crystal and is lower with higher motional capacitance.

The high negative starting impedance of  $R_{XTO12\_START} > 1500\Omega$  is important to minimize the failure rate due to the “sleeping crystal” phenomena (more common among very small sized 3.2mm  $\times$  2.5mm crystals).

### 3.4 Clock Driver

The clock driver block shown in [Figure 1-1 on page 2](#) is programmed using the CLK\_ONLY, CLK\_ON, and DIV\_CNTRL bits in the configuration register. When CLK\_ONLY is “clear”, normal operation is selected and the fractional-N PLL is operating. When CLK\_ON is “set”, the CLK output is enabled. The crystal clock divider ratio can be set to divide by four when DIV\_CNTRL is “set” and divide by eight when DIV\_CNTRL is “clear”. With a 13.0000MHz crystal, this yields an output of 3.25MHz or 1.625MHz, respectively. When CLK\_ON is “clear”, no clock is available at CLK and the transmitter has less current consumption.

The CLK signal can be used to clock a microcontroller. It is CMOS compatible and can drive up to 20pF of load capacitance at 1.625MHz and up to 10pF at 3.25MHz. When the device is in power-down mode, the CLK output stays low. Upon power up, CLK output remains low until the amplitude detector of the crystal oscillator detects sufficient amplitude and XTO\_RDY and CLK\_ON are “set”. After this takes place, CLK output becomes active. The CLK output is synchronized with the XTO\_RDY signal so that the first period of the CLK output is always a full period (no CLK output spike at activation).

To lower overall current consumption, it is possible to power down the entire chip except for the crystal oscillator block. This can be achieved when the CLK\_ONLY is “set”.

The PCB loop antenna should not exceed a trace width of 1.5mm otherwise the Q-factor of the loop antenna is too high. C4 and C5 should be selected so that the XTO runs on the load resonance frequency of the crystal. A crystal with a load capacitance of 9pF is recommended for proper start-up behavior and low current consumption. When determining values for C4 and C5, a parasitic capacitance of 3pF should be included. With value of 15pF for C4 and C5, an effective load capacitance of 9pF can be achieved e.g.  $9\text{pF} = (15\text{pF} + 3\text{pF})/2$ . The supply  $V_S$  is typically delivered from a single Li-Cell.

#### 4.1.1 Antenna Impedance Matching

The maximum output power is achieved by using load impedances according to [Table 4-1](#) and [Table 4-2 on page 9](#) and the output power. The load impedance  $Z_{\text{LOPT}}$  is defined as the impedance seen from the Atmel® ATA5749 ANT1, ANT2 into the matching network. This is not the output impedance of the IC but essentially the peak voltage divided by the peak current with some additional parasitic effects (Cpar). [Table 4-1](#) and [Table 4-2 on page 9](#) do not contain information pertaining to C3 in [Figure 4-2](#), which is an option for better matching at low power steps.

[Figure 4-2](#) is the circuit that was used to obtain the typical output power measurements in [Figure 4-3 on page 10](#) and typical current consumption in [Figure 4-4 on page 10](#). [Table 4-1](#) and [Table 4-2 on page 9](#) provide recommended values and performance info at various output power levels. For reference,  $Z_{\text{LOPT}}$  is defined as the impedance seen from the ATA5749 ANT1, ANT2 into the matching network.

**Figure 4-2.** Output Power Measurement Circuit

The used parts at [Table 4-1](#) and [Table 4-2](#) are:

Inductors: high Q COILCRAFT 0805CS; Capacitors: AVX ACCU-P 0402

**Table 4-1.** Measured PA Matching at 315MHz (CLK\_ON = "LOW") at Typ. Samples

| PWR Register | Desired Power (dBm) | L1 (nH) | C1 (pF) | C2 (pF) | R <sub>LOPT</sub> (Ω) | Z <sub>LOPT</sub> (Ω) | Cpar (pF) | Actual Power (dBm) |
|--------------|---------------------|---------|---------|---------|-----------------------|-----------------------|-----------|--------------------|

**Figure 4-3.** Typical Measured Output Power

**Figure 4-4.** Typical Current Consumption I at Port VS

## 5. Pulling of Frequency due to ASK Modulation (PA Switching)

The switching effect on VCO frequency in ASK Mode is very low if a correct PCB layout and decoupling is used. Therefore, power ramping is not needed to achieve a clean spectrum (see [Figure 5-1](#)).

**Figure 5-1.** Typical RF Spectrum of 40kHz ASK Modulation at Pout = 12.5dBm

## 6. Configuration Register

### 6.1 General Description

The user must program all 32 bits of the configuration register upon power up (EN = HIGH) or whenever changes to operating parameters are desired. The configuration register bit assignments and descriptions can be found in [Table 6-1](#) and [Table 6-2](#).

**Table 6-1.** Organization of the Control Register

| MSB  |           |           |           |           |           |           |          |          |  |          |          |          |          |          |          |  |

| CLK_ON     | 0         | 1    | CLK_DRV port control<br>HIGH = CLK port is ON<br>LOW = CLK port is OFF  |

## 6.2 Programming

The configuration register is programmed serially using the SPI bus, starting with the MSB. It consists of the Enable line (EN), the Data line (SDIN\_TXDIN), and the SPI-Bus Clock (SCK). The SDIN\_TXDIN data is loaded on the positive edge of the SCK. The contents of the configuration register become programmed on the negative SCK edge of the last bit (LSB) of the programming sequence. The timing of this bus is shown in Figure 6-1. Note that the maximum usable clock speed on the SPI bus is limited to 2MHz.

Figure 6-1. SPI Bus Timing

At the conclusion of the 32 bit programming sequence, the SDIN\_TXDIN line becomes the modulation input for the RF transmitter. After programming is complete, the SCK signal has no effect on the device. To disable the transmitter and enter the OFF Mode, EN and SDIN\_TXDIN must be returned to the LOW state. For clarity, several additional timing diagrams are included. Figure 6-2 shows the situation when the programming terminates faster than the XTO is ready.

Figure 6-2. Timing Diagram if Register Programming is Faster than  $\Delta T_{XTO}$

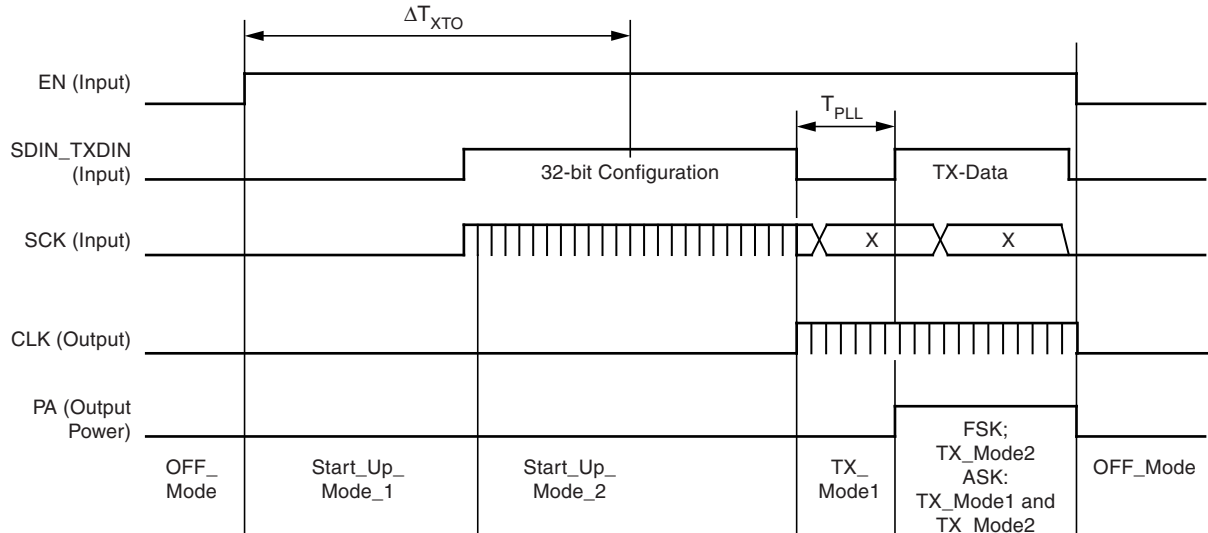

Figure 6-3 shows the combination with slow programming and a faster ramp up of XTO. A diagram of the operating modes is shown in Figure 6-5 on page 16 and a description of which circuit blocks are active is provided in Table 6-3 on page 15. This also contains the information needed for the calculation of consumed charge for one operation cycle.

**Figure 6-3.** Timing Diagram if Programming is Slower than  $T_{XTO}$

### 6.3 Reprogramming without Stopping the Crystal Oscillator

After the configuration register is programmed and RF data transmission is completed, the OFF mode is normally entered. This stops the crystal oscillator and PLL. If it is desirable to modify the contents of the configuration register without entering the OFF mode, the Reset\_Register\_Mode can be used. To enter the Reset\_Register\_Mode, the SDIN\_TXDIN must be asserted HIGH while the EN is asserted LOW for at least  $10\mu s$  Reset\_min time. This state is shown in Figure 6-4 on page 15, State Diagram of Operating Modes. In Reset\_Register\_Mode, the PA and fractional PLL remain OFF but the XTO remains active. This state must stay for minimum  $10\mu s$ . At the next step you must rise first EN and SDIN\_TXDIN  $10\mu s$  delayed. While in this mode, the 32 bit configuration register data can be sent on the SPI bus as shown in Figure 6-2 on page 13. After data transmission, the device can be switched back to OFF\_Mode by asserting EN, SCK, and SDIN\_TXDIN to a LOW state. An example of programming from the Reset\_Register\_Mode is shown in Figure 6-4 on page 15.

Figure 6-4. Timing Diagram when using Reset\_Register\_Mode

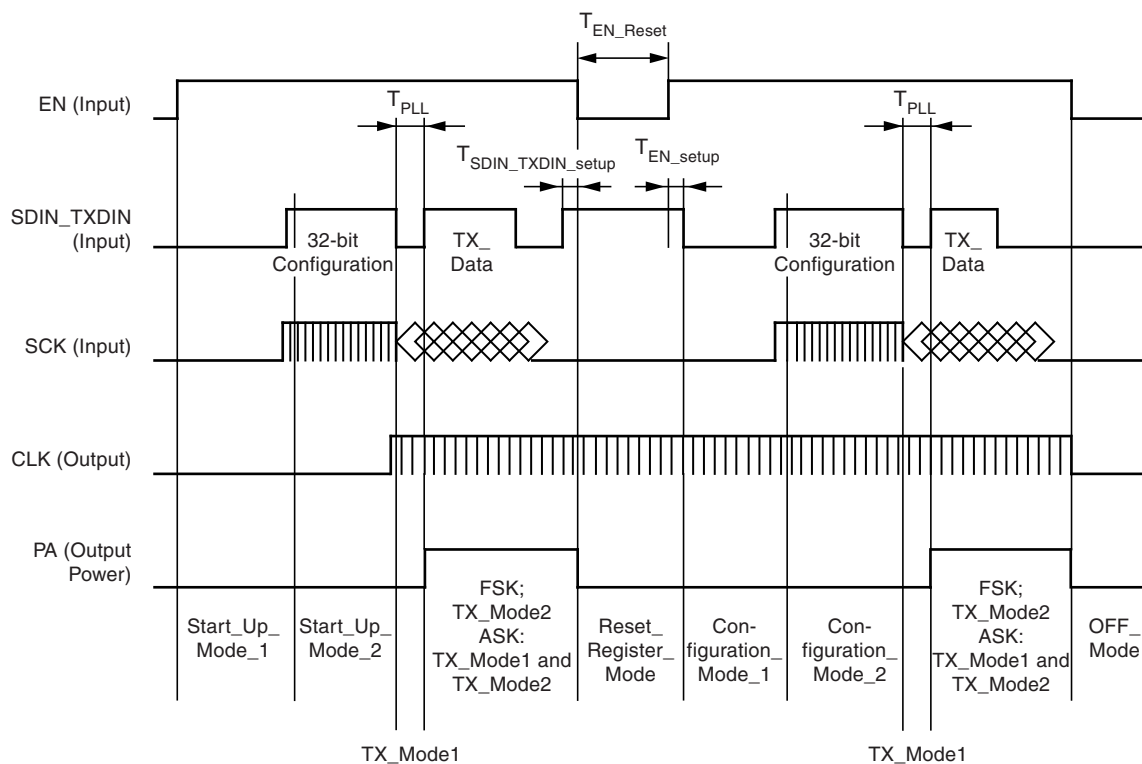

Table 6-3. Active Circuits as a Function of Operating Mode

| Operating Mode       | Active Circuit Blocks  |
|----------------------|--|
| OFF_Mode             | -none-   |
| Start_Up_Mode_1      | Power up/down; XTO; digital control  |
| Start_Up_Mode_2      | Power up/down; XTO; digital control; fractional-N-PLL                              |
| TX_Mode1             | Power up/down; XTO; digital control; fractional-N-PLL; CLK_DRV <sup>(1)</sup>      |
| TX_Mode2             | Power up/down; XTO; digital control; fractional-N-PLL; CLK_DRV <sup>(1)</sup> ; PA |
| Clock_Only_Mode      | Power up/down; XTO; digital control; CLK_DRV <sup>(1)</sup>                        |
| Reset_Register_Mode  | Power up/down; XTO; digital control; CLK_DRV <sup>(1)</sup>                        |
| Configuration_Mode_1 | Power up/down; XTO; digital control; CLK_DRV <sup>(1)</sup>                        |
| Configuration_Mode_2 | Power up/down; XTO; digital control; CLK_DRV <sup>(1)</sup> ; fractional-N-PLL     |

Note: 1. Only if activated with CLK\_ON = HIGH

**Figure 6-5. State Diagram of Operating Modes**

1) "register partly programmed": negative SCK edge of 32-bit register programming MSB-1 (S433\_N315)

2) "register programmed" negative SCK edge of 32-bit register programming LSB (CLK\_ON)

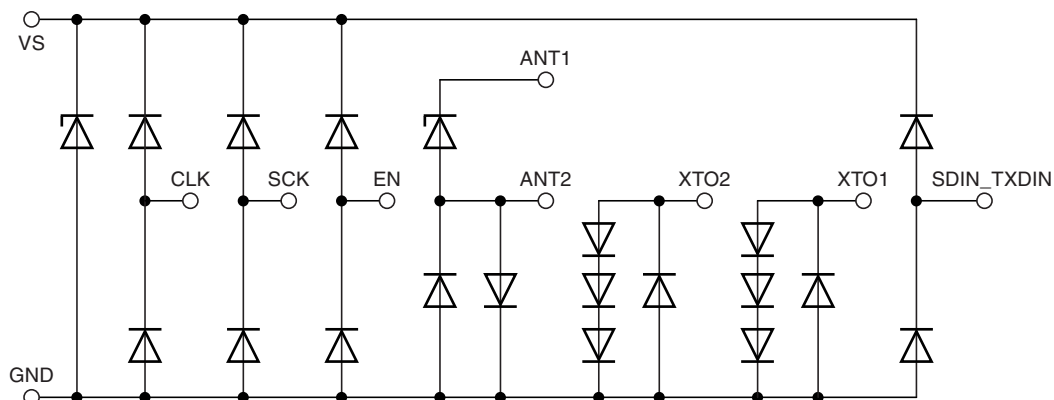

3) "PLL locked" 1280 XTO cycles (T<sub>PLL</sub>) after register programmed and XTO\_RDY = 'High'

To transition from one state to another, only the conditions next to the transition arrows must be fulfilled. No additional settings are required.

## 7. ESD Protection Circuit

Figure 7-1. ESD Protection Circuit

## 8. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| Parameters  | Symbol     | Min. | Max. | Unit |
|---|------------|------|------|------|
| Supply voltage  | $V_S$      | -0.3 | +4.0 | V    |
| Power dissipation   | $P_{tot}$  |      | 100  | mW   |
| Junction temperature  | $T_j$      |      | 150  | °C   |
| Storage temperature   | $T_{stg}$  | -55  | +125 | °C   |
| Ambient temperature   | $T_{amb1}$ | -40  | +125 | °C   |
| Ambient temperature in power-down mode for 30 minutes without damage with $V_S \leq 3.2V$ , $V_{ENABLE} < 0.25V$ or ENABLE is open, $V_{ASK} < 0.25V$ , $V_{FSK} < 0.25V$ | $T_{amb2}$ |      | 175  | °C   |
| ESD (Human Body Model ESD S5.1) every pin excluding pin 5 (ANT1)  | HBM        | -4   | +4   | kV   |
| ESD (Human Body Model ESD S5.1) for pin 5 (ANT1)  | HBM        | -2   | +2   | kV   |
| ESD (Machine Model JEDEC A115A) every pin excluding pin 5 (ANT1)  | MM         | -200 | +200 | V    |
| ESD (Machine Model JEDEC A115A) for pin 5 (ANT1)  | MM         | -150 | +150 | V    |
| ESD – STM 5.3.1-1999 every pin  | CDM        |      | 750  | V    |

## 9. Thermal Resistance

| Parameters                           | Symbol     | Value | Unit |
|--------------------------------------|------------|-------|------|
| Thermal resistance, junction ambient | $R_{thJA}$ | 170   | K/W  |

## 10. Electrical Characteristics

$V_S = 1.9V$  to  $3.6V$   $T_{amb} = -40^{\circ}C$  to  $+125^{\circ}C$ ,  $CLK\_ON = "High"$ ;  $DIV\_CNTRL = "Low"$ ,  $CLOAD\_CLK = 10pF$ ,  $f_{XTO} = 13.0000MHz$ ,  $f_{CLK} = 1.625MHz$  unless otherwise specified. If crystal parameters are important values correspond to a crystal with  $C_M = 4.0fF$ ,  $C_0 = 1.5pF$ ,  $C_{LOAD} = 9pF$  and  $R_M \leq 170\Omega$ . Typical values are given at  $V_S = 3.0V$  and  $T_{amb} = 25^{\circ}C$

\*) Type means: A = 100% tested, B = 100% correlation tested, C = Characterized on samples, D = Design parameter

## 12. Digital Port Characteristics

$V_S = 1.9V$  to  $3.6V$ ,  $T_{amb} = 40^\circ C$  to  $+125^\circ C$  unless otherwise specified. Typical values are given at  $V_S = 3.0V$  and  $T_{amb} = 25^\circ C$ , all inputs are Schmitt trigger interfaces.

| No. | Parameters | Test Conditions             | Pin | Symbol    | Min.         | Typ. | Max.  | Unit      | Type* |
|-----|------------|-----------------------------|-----|-----------|--------------|------|-------|-----------|-------|
| 1.1 | SDIN_TXDIN | "Low" level input voltage   |     | $V_{ll}$  | 0            |      | 0.25  | V         | A     |
|     |            | "High" level input voltage  |     | $V_{ih}$  | $V_S - 0.25$ |      | $V_S$ | V         |       |
|     |            | Internal pull-down resistor |     | $R_{PDN}$ | 160          | 250  | 380   | $k\Omega$ |       |
| 1.2 | SCK        | "Low" level input voltage   |     | $V_{ll}$  | 0            |      | 0.25  | V         | A     |

### 13. Ordering Information

| Extended Type Number | Package | Remarks |
|----------------------|---------|---------|
| ATA5749-6DQ          | TSSOP10 | -       |

### 14. Package Information

Package: TSSOP 10  
 (acc. to JEDEC Standard MO-187)  
 Dimensions in mm  
 Not indicated tolerances  $\pm 0.05$

Drawing-No.: 6.543-5095.01-4  
 Issue: 3; 16.09.05

## 15. Revision History

Please note that the following page numbers referred to in this section refer to the specific revision mentioned, not to this document.

| Revision No.    | History  |
|-----------------|--|
| 9128E-RKE-09/10 | <ul style="list-style-type: none"> <li>• El. Char. table: rows 1.2, 1.3, 1.4, 1.7, 1.8, 1.9, 2.1, 2.2, 2.4, 2.5 changed</li> <li>• Dig. Port Char. table: row 1.3 changed</li> <li>• Ordering table changed</li> </ul>   |
| 9128D-RKE-01/09 | <ul style="list-style-type: none"> <li>• Features on page 1 changed</li> <li>• Section 8 “Absolute Maximum Ratings” on page 17 changed</li> </ul>  |
| 9128C-RKE-10/08 | <ul style="list-style-type: none"> <li>• Features on page 1 changed</li> <li>• Section 8 “Absolute Maximum Ratings” on page 17 changed</li> <li>• Section 12 “Digital Port Characteristics” on page 23 changed</li> </ul>  |
| 9128B-RKE-08/08 | <ul style="list-style-type: none"> <li>• Put datasheet in the newest template</li> <li>• Features on page 1 changed</li> <li>• Section 1 “Description” on page 1 changed</li> <li>• Figure 1-1 “Block Diagram” on page 2 changed</li> <li>• Section 3.1 “Fractional-N PLL” on page 4 changed</li> <li>• Section 3.4 “Clock Driver” on page 6 changed</li> <li>• Figure 4-1 “Typical Application Circuit” on page 7 changed</li> <li>• Figure 4-2 “Output Power Measurement Circuit” on page 8 changed</li> <li>• Section 10 “Electrical Characteristics” numbers 4.2, 4.12 and 4.13 on pages 20 to 21 changed</li> </ul> |

## Headquarters

---

**Atmel Corporation**  
2325 Orchard Parkway  
San Jose, CA 95131  
USA  
Tel: 1(408) 441-0311  
Fax: 1(408) 487-2600

## International

---

**Atmel Asia**  
Unit 1-5 & 16, 19/F  
BEA Tower, Millennium City 5  
418 Kwun Tong Road  
Kwun Tong, Kowloon  
Hong Kong  
Tel: (852) 2245-6100  
Fax: (852) 2722-1369

**Atmel Europe**  
Le Krebs  
8, Rue Jean-Pierre Timbaud  
BP 309  
78054  
Saint-Quentin-en-Yvelines Cedex  
France  
Tel: (33) 1-30-60-70-00  
Fax: (33) 1-30-60-71-11

**Atmel Japan**  
9F, Tonetsu Shinkawa Bldg.  
1-24-8 Shinkawa  
Chuo-ku, Tokyo 104-0033  
Japan
