

8M x 16 DDR Synchronous DRAM (SDRAM)

Etron Confidential

Advanced (Rev. 1.1 Feb. /2009)

Features

- Fast clock rate: 200MHz
- Differential Clock CK & \overline{CK} input
- Bi-directional DQS
- DLL enable/disable by EMRS
- Fully synchronous operation
- Internal pipeline architecture
- Four internal banks, 2M x 16-bit for each bank
- Programmable Mode and Extended Mode registers
 - CAS Latency: 2, 2.5, 3
 - Burst length: 2, 4, 8
 - Burst Type: Sequential & Interleaved
- Individual byte write mask control
- DM Write Latency = 0
- Auto Refresh and Self Refresh
- 4096 refresh cycles / 64ms
- Precharge & active power down
- Power supplies: VDD & VDDQ = 2.5V \pm 5%
- Interface: SSTL_2 I/O Interface
- Package: 66 Pin TSOP II, 0.65mm pin pitch
 - Pb free and Halogen free

Overview

The EM6A9160 SDRAM is a high-speed CMOS double data rate synchronous DRAM containing 128 Mbits. It is internally configured as a quad 2M x 16 DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CK). Data outputs occur at both rising edges of CK and \overline{CK} . Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of a BankActivate command which is then followed by a Read or Write command. The EM6A9160 provides programmable Read or Write burst lengths of 2, 4, or 8. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence. The refresh functions, either Auto or Self Refresh are easy to use. In addition, EM6A9160 features programmable DLL option. By having a programmable mode register and extended mode register, the system can choose the most suitable modes to maximize its performance. These devices are well suited for applications requiring high memory bandwidth and high performance.

Table 1. Ordering Information

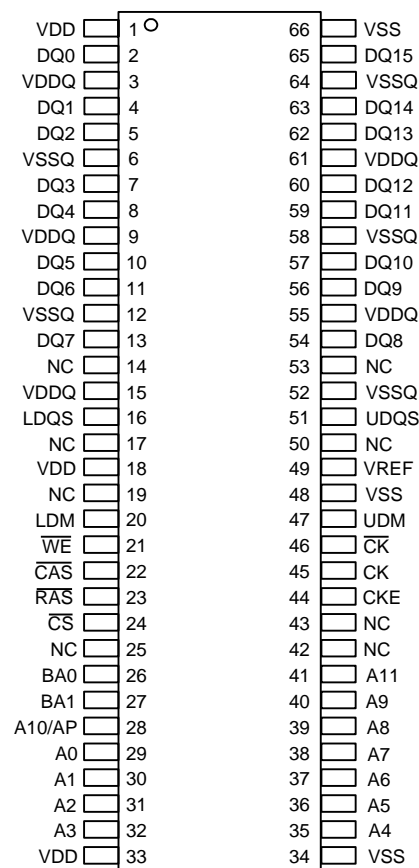

Part Number	Clock Frequency	Data Rate	Package
EM6A9160TSA-5G	200MHz	400Mbps/pin	TSOPII

TS: indicates TSOP II package

A: indicates Generation Code

G: indicates Pb and Halogen Free for TSOPII Package

Pin Descriptions

Table 2. Pin Details of EM6A9160

Symbol	Type	Description
CK, \overline{CK}	Input	Differential Clock: CK, \overline{CK} are driven by the system clock. All SDRAM input signals are sampled on the positive edge of CK. Both CK and \overline{CK} increment the internal burst counter and controls the output registers.
CKE	Input	Clock Enable: CKE activates (HIGH) and deactivates (LOW) the CK signal. If CKE goes low synchronously with clock, the internal clock is suspended from the next clock cycle and the state of output and burst address is frozen as long as the CKE remains low. When all banks are in the idle state, deactivating the clock controls the entry to the Power Down and Self Refresh modes.
BA0, BA1	Input	Bank Activate: BA0 and BA1 define to which bank the BankActivate, Read, Write, or BankPrecharge command is being applied.
A0-A11	Input	Address Inputs: A0-A11 are sampled during the BankActivate command (row address A0-A11) and Read/Write command (column address A0-A8 with A10 defining Auto Precharge).
\overline{CS}	Input	Chip Select: \overline{CS} enables (sampled LOW) and disables (sampled HIGH) the command decoder. All commands are masked when \overline{CS} is sampled HIGH. \overline{CS} provides for external bank selection on systems with multiple banks. It is considered part of the command code.
\overline{RAS}	Input	Row Address Strobe: The \overline{RAS} signal defines the operation commands in conjunction with the \overline{CAS} and \overline{WE} signals and is latched at the positive edges of CK. When \overline{RAS} and \overline{CS} are asserted "LOW" and \overline{CAS} is asserted "HIGH," either the BankActivate command or the Precharge command is selected by the \overline{WE} signal. When the \overline{WE} is asserted "HIGH," the BankActivate command is selected and the bank designated by BA is turned on to the active state. When the \overline{WE} is asserted "LOW," the Precharge command is selected and the bank designated by BA is switched to the idle state after the precharge operation.
\overline{CAS}	Input	Column Address Strobe: The \overline{CAS} signal defines the operation commands in conjunction with the \overline{RAS} and \overline{WE} signals and is latched at the positive edges of CK. When \overline{RAS} is held "HIGH" and \overline{CS} is asserted "LOW," the column access is started by asserting \overline{CAS} "LOW." Then, the Read or Write command is selected by asserting \overline{WE} "HIGH" or "LOW".
\overline{WE}	Input	Write Enable: The \overline{WE} signal defines the operation commands in conjunction with the \overline{RAS} and \overline{CAS} signals and is latched at the positive edges of CK. The \overline{WE} input is used to select the BankActivate or Precharge command and Read or Write command.
LDQS, UDQS	Input / Output	Bidirectional Data Strobe: Specifies timing for Input and Output data. Read Data Strobe is edge triggered. Write Data Strobe provides a setup and hold time for data and DQM. LDQS is for DQ0~7, UDQS is for DQ8~15.
LDM, UDM	Input	Data Input Mask: Input data is masked when DM is sampled HIGH during a write cycle. LDM masks DQ0-DQ7, UDM masks DQ8-DQ15.
DQ0 - DQ15	Input / Output	Data I/O: The DQ0-DQ15 input and output data are synchronized with the positive edges of CK and \overline{CK} . The I/Os are byte-maskable during Writes.
VDD	Supply	Power Supply: +2.5V ±5%
VSS	Supply	Ground

VDDQ	Supply	DQ Power: +2.5V \pm 5%. Provide isolated power to DQs for improved noise immunity.
VSSQ	Supply	DQ Ground: Provide isolated ground to DQs for improved noise immunity.
VREF	Supply	Reference Voltage for Inputs: +0.5*VDDQ
NC	-	No Connect: No internal connection, these pins suggest to be left unconnected.

Operation Mode

Fully synchronous operations are performed to latch the commands at the positive edges of CK. Table 3 shows the truth table for the operation commands.

Table 3. Truth Table (Note (1), (2))

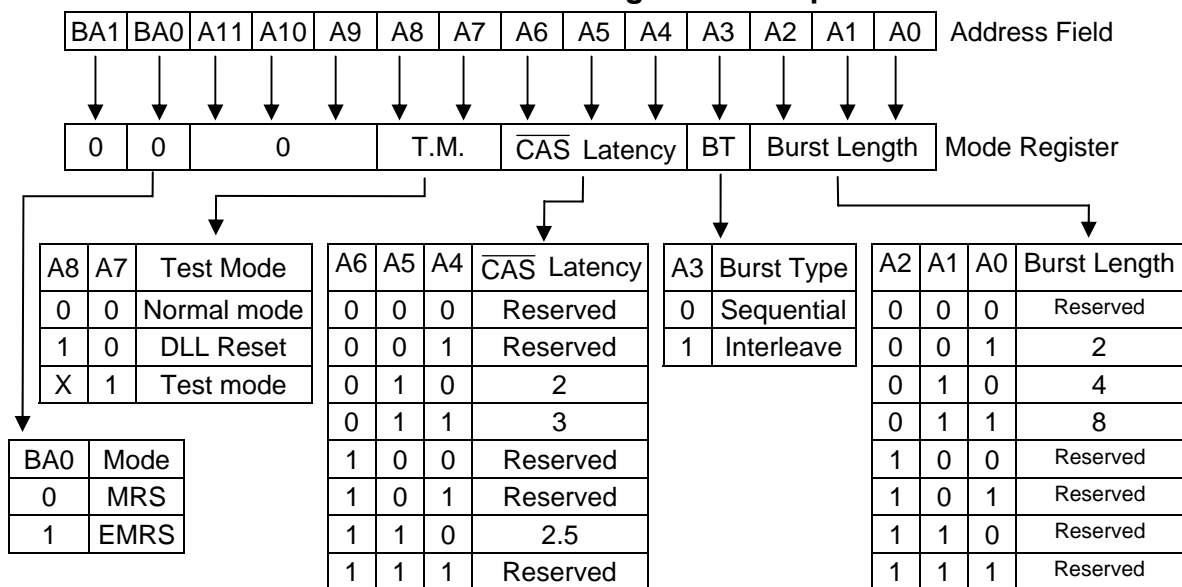

Command	State	CKE _{n-1}	CKE _n	UDM	LDM	BA _{0,1}	A10	A0-9,11	$\overline{\text{CS}}$	$\overline{\text{RAS}}$	$\overline{\text{CAS}}$	$\overline{\text{WE}}$

									L	H	H	H
Data Input Mask Disable	Active	H	X	L	L	X	X	X	X	X	X	X
Data Input Mask Enable ⁽⁵⁾	Active	H	X	H	H	X	X	X	X	X	X	X

- Note:**
1. V=Valid data, X=Don't Care, L=Low level, H=High level
 2. CKE_n signal is input level when commands are provided.
CKE_{n-1} signal is input level one clock cycle before the commands are provided.
 3. These are states of bank designated by BA signal.
 4. Device state is 2, 4, and 8 burst operation.
 5. LDM and UDM can be enabled respectively.

Mode Register Set (MRS)

The Mode Register stores the data for controlling various operating modes of a DDR SDRAM. It programs $\overline{\text{CAS}}$ Latency, Burst Type, and Burst Length to make the DDR SDRAM useful for a variety of applications. The default value of the Mode Register is not defined; therefore the Mode Register must be written by the user. Values stored in the register will be retained until the register is reprogrammed. The Mode Register is written by asserting Low on $\overline{\text{CS}}$, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$, BA1 and BA0 (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). The state of address pins A0~A11 and BA0, BA1 in the same cycle in which $\overline{\text{CS}}$, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ are asserted Low is written into the Mode Register. A minimum of two clock cycles, tMRD, are required to complete the write operation in the Mode Register. The Mode Register is divided into various fields depending on functionality. The Burst Length uses A0~A2, Burst Type uses A3, and $\overline{\text{CAS}}$ Latency (read latency from column address) uses A4~A6. A logic 0 should be programmed to all the undefined addresses to ensure future compatibility. Reserved states should not be used to avoid unknown device operation or incompatibility with future versions. Refer to the table for specific codes for various burst lengths, burst types and $\overline{\text{CAS}}$ latencies.

Table 4. Mode Register Bitmap

- Burst Length Field (A2~A0)

This field specifies the data length of column access using the A2~A0 pins and selects the Burst Length to be 2, 4, and 8.

Table 5. Burst Length

A2	A1	A0	Burst Length
0	0	0	Reserved
0	0	1	2
0	1	0	4
0	1	1	8
1	0	0	Reserved
1	0	1	Reserved
1	1	0	Reserved
1	1	1	Reserved

- Addressing Mode Select Field (A3)

The Addressing Mode can be one of two modes, either Interleave Mode or Sequential Mode. Both Sequential Mode and Interleave Mode support burst length of 2, 4, and 8.

Table 6. Addressing Mode

A3	Addressing Mode
0	Sequential
1	Interleave

- Burst Definition, Addressing Sequence of Sequential and Interleave Mode

Table 7. Burst Address ordering

Burst Length	Start Address			Sequential	Interleave
	A2	A1	A0		
2	X	X	0	0, 1	0, 1
	X	X	1	1, 0	1, 0
4	X	0	0	0, 1, 2, 3	0, 1, 2, 3
	X	0	1	1, 2, 3, 0	1, 0, 3, 2

	1	1	1	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

- $\overline{\text{CAS}}$ Latency Field (A6~A4)

This field specifies the number of clock cycles from the assertion of the Read command to the first read data. The minimum whole value of $\overline{\text{CAS}}$ Latency depends on the frequency of CK. The minimum whole value satisfying the following formula must be programmed into this field.

$$t_{\text{CAC}}(\text{min}) \leq \overline{\text{CAS}} \text{ Latency} \times t_{\text{CK}}$$

Table 8. CAS Latency

A6	A5	A4	CAS Latency
0	0	0	Reserved
0	0	1	Reserved
0	1	0	2 clocks
0	1	1	3 clocks
1	0	0	Reserved
1	0	1	Reserved
1	1	0	2.5 clocks
1	1	1	Reserved

- Test Mode field (A8~A7)

These two bits are used to enter the test mode and must be programmed to "00" in normal operation.

Table 9. Test Mode

A8	A7	Test Mode
0	0	Normal mode
1	0	DLL Reset
X	1	Test mode

- (BA0, BA1)

Table 10. MRS/EMRS

BA1	BA0	A11 ~ A0
RFU	0	MRS Cycle
RFU	1	Extended Functions (EMRS)

Extended Mode Register Set (EMRS)

The Extended Mode Register Set stores the data for enabling or disabling DLL and selecting output driver strength. The default value of the extended mode register is not defined, therefore must be written after power up for proper operation. The extended mode register is written by asserting low on \overline{CS} , \overline{RAS} , \overline{CAS} , and \overline{WE} . The state of A0, A2 ~ A5, A7 ~ A11 and BA1 is written in the mode register in the same cycle as \overline{CS} , \overline{RAS} , \overline{CAS} , and \overline{WE} going low. The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the extended mode register. A1 and A6 are used for setting driver strength to normal, weak or matched impedance. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. Refer to the table for specific codes.

Table 12. Absolute Maximum Rating

Symbol	Item	Rating	Unit	Note
		-5		
V _{IN} , V _{OUT}	I/O Pins Voltage	- 0.5~V _{DDQ} + 0.5	V	1,2
V _{IN}	V _{REF} and Inputs Voltage	- 1~3.6	V	1,2
V _{DD} , V _{DDQ}	Power Supply Voltage	- 1~3.6	V	1,2
T _A	Ambient Temperature	0~70	°C	1
T _{STG}	Storage Temperature	- 55~150	°C	1
P _D	Power Dissipation	1	W	1
I _{OUT}	Short Circuit Output Current	50	mA	1

Note1: Stress greater than those listed under "Absolute Maximum Ratings" may cause permanent damage of the devices

Note2: These voltages are relative to V_{SS}

Table 13. Recommended D.C. Operating Conditions (T_A = 0 ~ 70 °C)

Parameter	Symbol	Min.	Max.	Unit	Note
Power Supply Voltage	V _{DD}	2.375	2.625	V	1,2
Power Supply Voltage (for I/O Buffer)	V _{DDQ}	2.375	2.625	V	1,2
Input Reference Voltage	V _{REF}	0.49* V _{DDQ}	0.51* V _{DDQ}	V	
Termination Voltage	V _{TT}	V _{REF} - 0.04	V _{REF} + 0.04	V	
Input High Voltage (DC)	V _{IH} (DC)	V _{REF} + 0.15	V _{DDQ} + 0.3	V	
Input Low Voltage (DC)	V _{IL} (DC)	-0.3	V _{REF} - 0.15	V	
Input Voltage Level, CK and \overline{CK} inputs	V _{IN} (DC)	-0.3	V _{DDQ} + 0.3	V	1,2
Input Leakage current	I _I	-5	5	μA	
Output Leakage current	I _{OZ}	-5	5	μA	
Output High Voltage	V _{OH}	V _{TT} + 0.76	-	V	I _{OH} = -15.2 mA
Output Low Voltage	V _{OL}	-	V _{TT} - 0.76	V	I _{OL} = +15.2mA

Table 14. Capacitance (V_{DD} = 2.5V±5%, f = 1MHz, T_A = 25 °C)

Symbol	Parameter	Min.	Max.	Unit
C _{IN1}	Input Capacitance (CK, \overline{CK})	2	4	pF
C _{IN2}	Input Capacitance (All other input-only pins)	2	4	pF
C _{I/O}	DQ, DQS, DM Input/Output Capacitance	4	6	pF

Note: These parameters are guaranteed by design, periodically sampled and are not 100% tested

Table 15. D.C. Characteristics (VDD = 2.5V ± 5%, TA = 0~70 °C)

Parameter & Test Condition	Symbol	-5	Unit
		Max	
OPERATING CURRENT: One bank; Active-Precharge; tRC=tRC (min); tCK=tCK(min); DQ,DM and DQS inputs changing once per clock cycle; Address and control inputs changing once every two clock cycles.	IDD0	120	mA
OPERATING CURRENT : One bank; Active-Read-Precharge; BL=4; tRC=tRC(min); tCK=tCK(min); Iout=0mA; Address and control inputs changing once per clock cycle	IDD1	140	mA
PRECHARGE POWER-DOWN STANDBY CURRENT: All banks idle; power-down mode; tCK=tCK(min); CKE=LOW	IDD2P	10	mA
IDLE STANDLY CURRENT : CKE = HIGH; \overline{CS} =HIGH(DESELECT); All banks idle; tCK=tCK(min); Address and control inputs changing once per clock cycle; VIN=VREF for DQ, DQS and DM	IDD2N	50	mA
ACTIVE POWER-DOWN STANDBY CURRENT : one bank active; power-down mode; CKE=LOW; tCK=tCK(min)	IDD3P	40	mA
ACTIVE STANDBY CURRENT : \overline{CS} =HIGH;CKE=HIGH; one bank active ; tRC=tRC(max);tCK=tCK(min);Address and control inputs changing once per clock cycle; DQ,DQS,and DM inputs changing twice per clock cycle	IDD3N	80	mA
OPERATING CURRENT BURST READ : BL=2; READS; Continuous burst; one bank active; Address and control inputs changing once per clock cycle; tCK=tCK(min); Iout=0mA;50% of data changing on every transfer	IDD4R	180	mA
OPERATING CURRENT BURST Write : BL=2; WRITES; Continuous Burst ;one bank active; address and control inputs changing once per clock cycle; tCK=tCK(min); DQ,DQS,and DM changing twice per clock cycle; 50% of data changing on every transfer	IDD4W	180	mA
AUTO REFRESH CURRENT : tRC=tRFC(min); tCK=tCK(min)	IDD5	200	mA
SELF REFRESH CURRENT: Self Refresh Mode ; CKE 0.2V;tCK=tCK(min)	IDD6	4	mA
BURST OPERATING CURRENT 4 bank operation: Four bank interleaving READS; BL=4;with Auto Precharge; tRC=tRC(min); tCK=tCK(min); Address and control inputschang only during Active, READ , or WRITE command	IDD7	300	mA

Table 17. Recommended A.C. Operating Conditions ($V_{DD} = 2.5V \pm 5\%$, $T_A = 0\sim 70\text{ }^\circ\text{C}$)

Parameter	Symbol	Min.	Max.	Unit	Note
Input High Voltage (AC)	V_{IH} (AC)	$V_{REF} + 0.35$	-	V	
Input Low Voltage (AC)	V_{IL} (AC)	-	$V_{REF} - 0.35$	V	
Input Different Voltage, CK and \overline{CK} inputs	V_{ID} (AC)	0.7	$V_{DDQ} + 0.6$	V	
Input Crossing Point Voltage, CK and \overline{CK} inputs	V_{IX} (AC)	$0.5 * V_{DDQ} - 0.2$	$0.5 * V_{DDQ} + 0.2$	V	

Note:

1. All voltages are referenced to V_{SS} .
2. These parameters depend on the cycle rate and these values are measured by the cycle rate under the minimum value of t_{CK} and t_{RC} . Input signals are changed one time during t_{CK} .
3. Power-up sequence is described in Note 5.
4. A.C. Test Conditions

Table 18. SSTL_2 Interface

Reference Level of Output Signals (V_{REF})	$0.5 * V_{DDQ}$
Output Load	Reference to the Test Load
Input Signal Levels (V_{IH} / V_{IL})	$V_{REF} + 0.35\text{ V} / V_{REF} - 0.35\text{ V}$
Input Signals Slew Rate	1 V/ns
Reference Level of Input Signals	$0.5 * V_{DDQ}$

Figure 4. SSTL_2 A.C. Test Load

5. Power up Sequence

Power up must be performed in the following sequence.

- 1) Apply power to V_{DD} before or at the same time as V_{DDQ} , V_{TT} and V_{REF} when all input signals are held "NOP" state and maintain CKE "LOW".
- 2) Start clock and maintain stable condition for minimum 200 μ s.
- 3) Issue a "NOP" command and keep CKE "HIGH"
- 4) Issue a "Precharge All" command.
- 5) Issue EMRS – enable DLL.
- 6) Issue MRS – reset DLL. (An additional 200 clock cycles are required to lock the DLL).
- 7) Precharge all banks of the device.
- 8) Issue two or more Auto Refresh commands.
- 9) Issue MRS – with A8 to low to initialize the mode register.

3 subsequent elements of Data In are applied in the programmed order following DI_n

 Don't Care

Figure 32. Data Output (Read) Timing

Burst Length = 4 in the case shown

Figure 33. Initialize and Mode Register Sets

*=VTT is not applied directly to the device, however t_{VTD} must be greater than or equal to zero to avoid device latch-up

**= t_{MRD} is required before any command can be applied, and 200 cycles of CK are required before any executable command can be applied

The two Auto Refresh commands may be moved to follow the first MRS but precede the second PRECHARGE ALL command

 Don't Care

Figure 34. Power Down Mode

No column accesses are allowed to be in progress at the time Power-Down is entered

*=If this command is a PRECHARGE ALL (or if the device is already in the idle state) then the Power-Down mode shown is Precharge Power Down. If this command is an ACTIVE (or if at least one row is already active) then the Power-Down mode shown is active Power Down.

 Don't Care

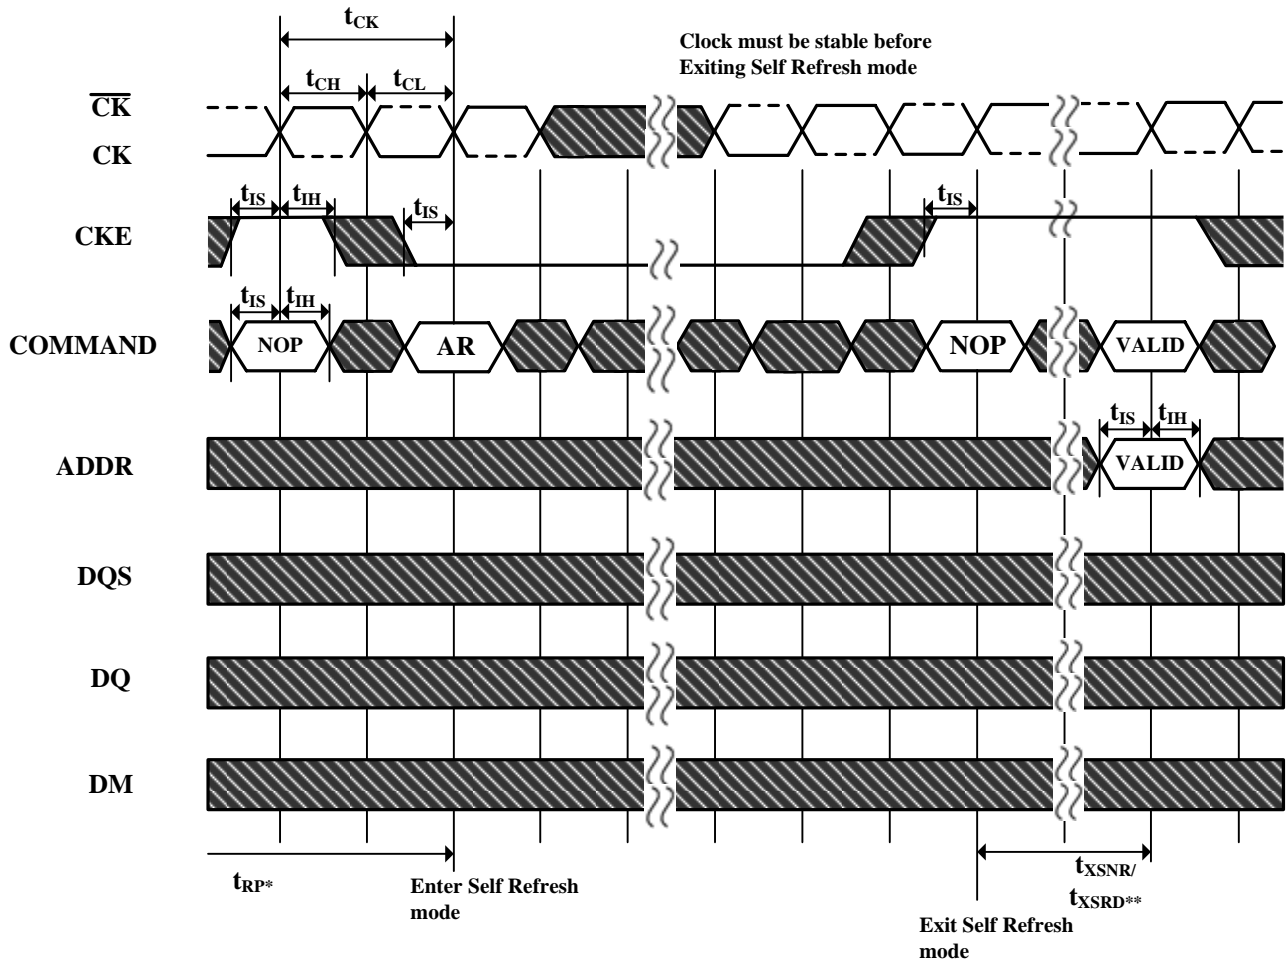

Figure 35. Auto Refresh Mode

* = Don't Care, if A10 is HIGH at this point; A10 must be HIGH if more than one bank is active (i.e., must precharge all active banks)
 PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address, AR = AUTOREFRESH
 NOP commands are shown for ease of illustration; other valid commands may be possible after tRFC
 DM, DQ and DQS signals are all Don't Care /High-Z for operations shown

 Don't Care

Figure 36. Self Refresh Mode

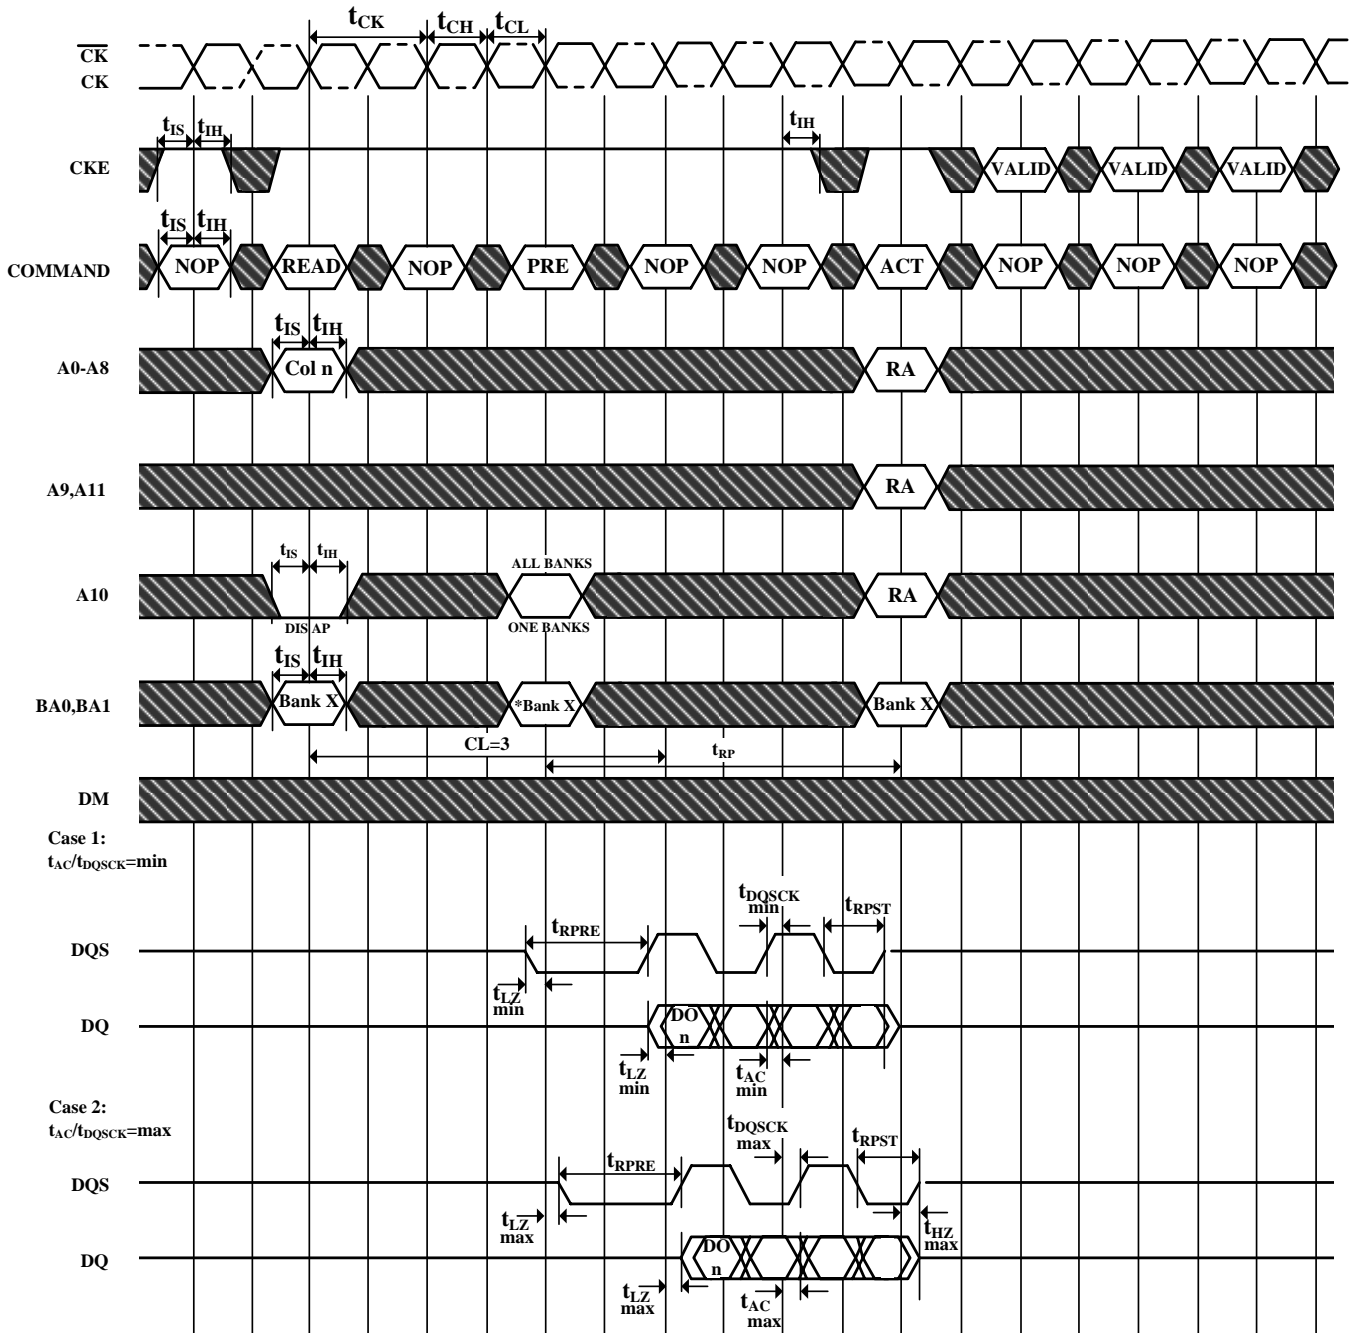

* = Device must be in the All banks idle state prior to entering Self Refresh mode

** = t_{XSNR} is required before any non-READ command can be applied, and t_{XSRD} (200 cycles of CK) is required before a READ command can be applied.

 Don't Care

Figure 37. Read without Auto Precharge

DO n = Data Out from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data Out are provided in the programmed order following DO n

DIS AP = Disable Autoprecharge

* = Don't Care, if A10 is HIGH at this point

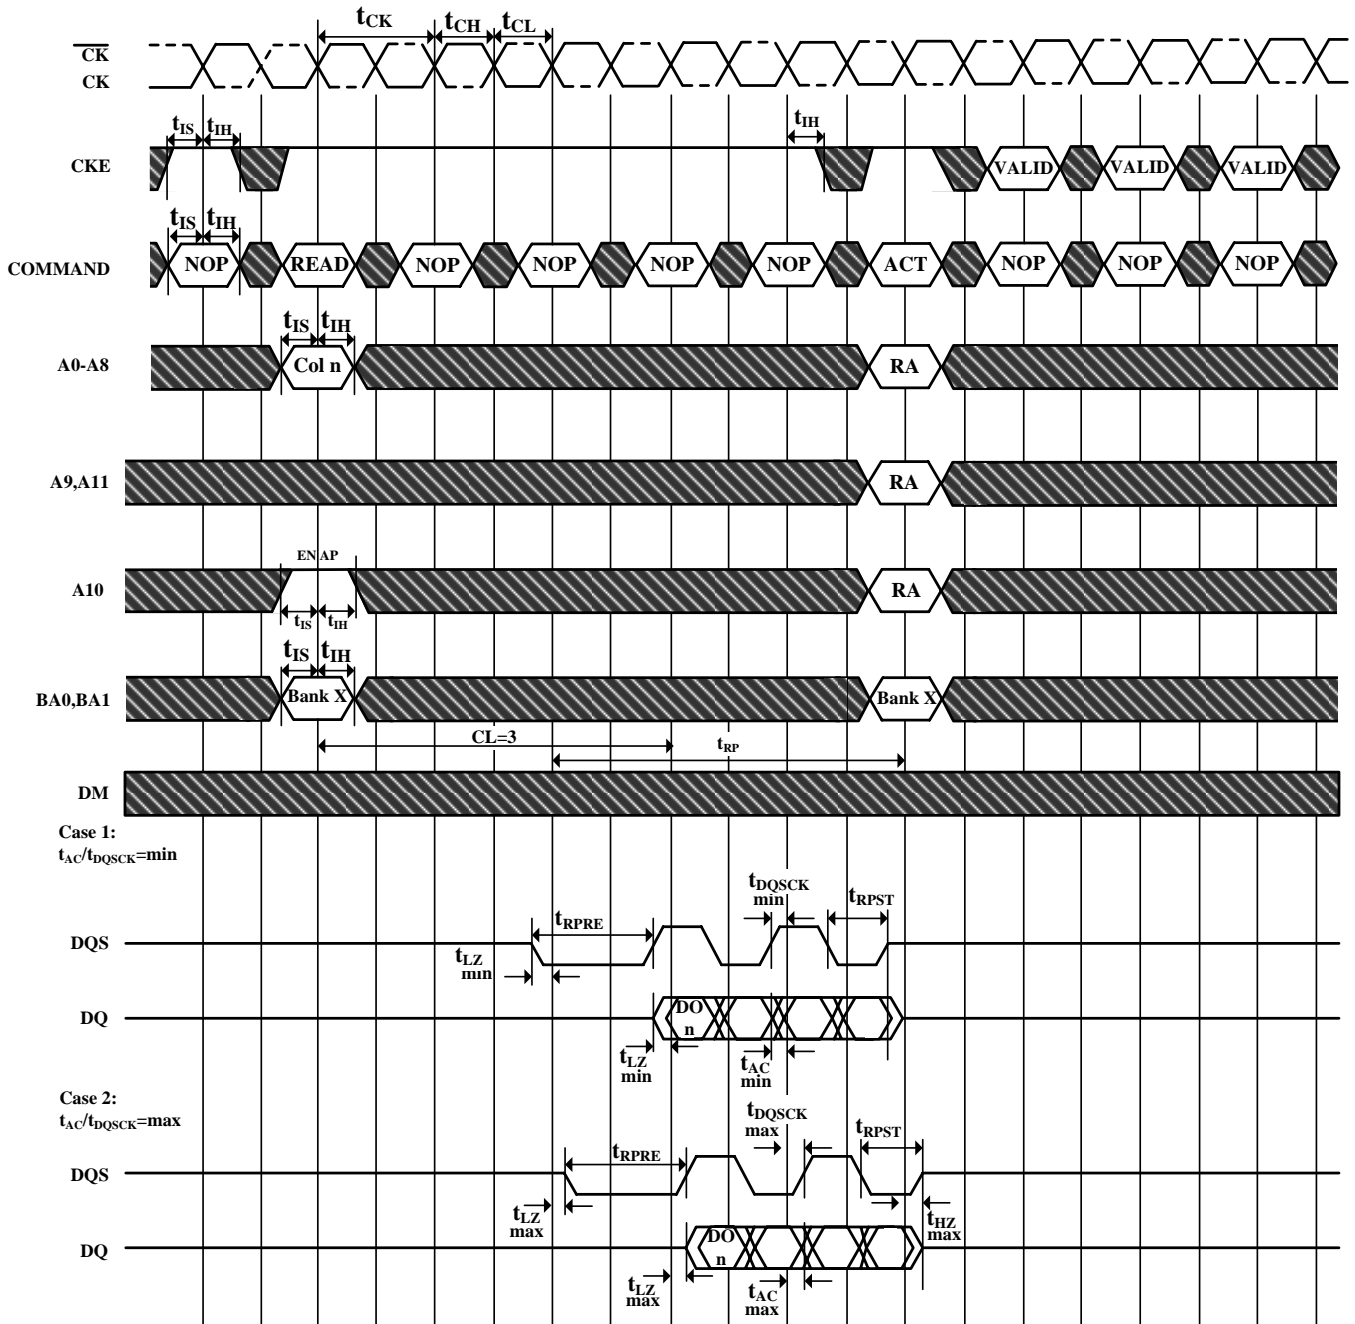

PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address, AR = AUTOREFRESH

NOP commands are shown for ease of illustration; other commands may be valid at these times

Precharge may not be issued before tRAS ns after the ACTIVE command for applicable banks

 Don't Care

Figure 38. Read with Auto Precharge

DO n = Data Out from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data Out are provided in the programmed order following DO n

EN AP = Enable Autoprecharge

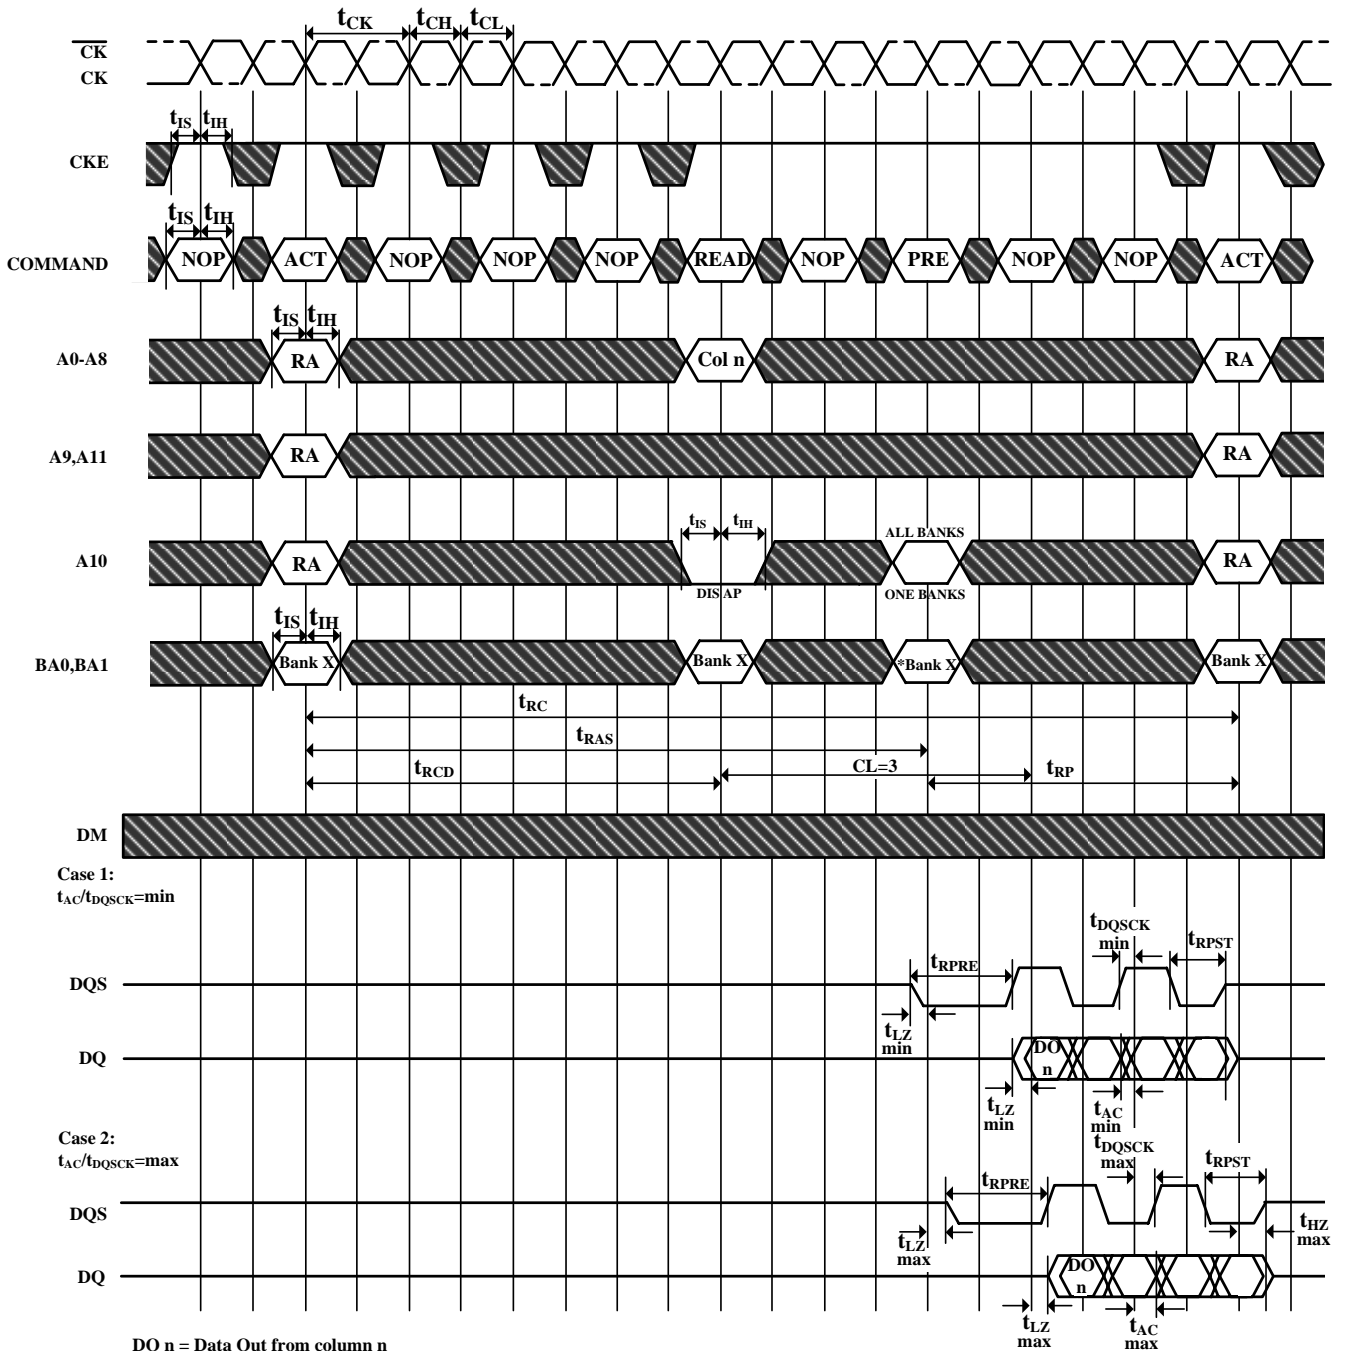

ACT = ACTIVE, RA = Row Address

NOP commands are shown for ease of illustration; other commands may be valid at these times

The READ command may not be issued until t_{RAP} has been satisfied. If Fast Autoprecharge is supported, $t_{RAP} = t_{RCD}$, else the READ may not be issued prior to $t_{RASmin} - (BL * t_{CK}/2)$

 Don't Care

Figure 39. Bank Read Access

DO n = Data Out from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data Out are provided in the programmed order following DO n

DIS AP = Disable Autoprecharge

* = Don't Care, if A10 is HIGH at this point

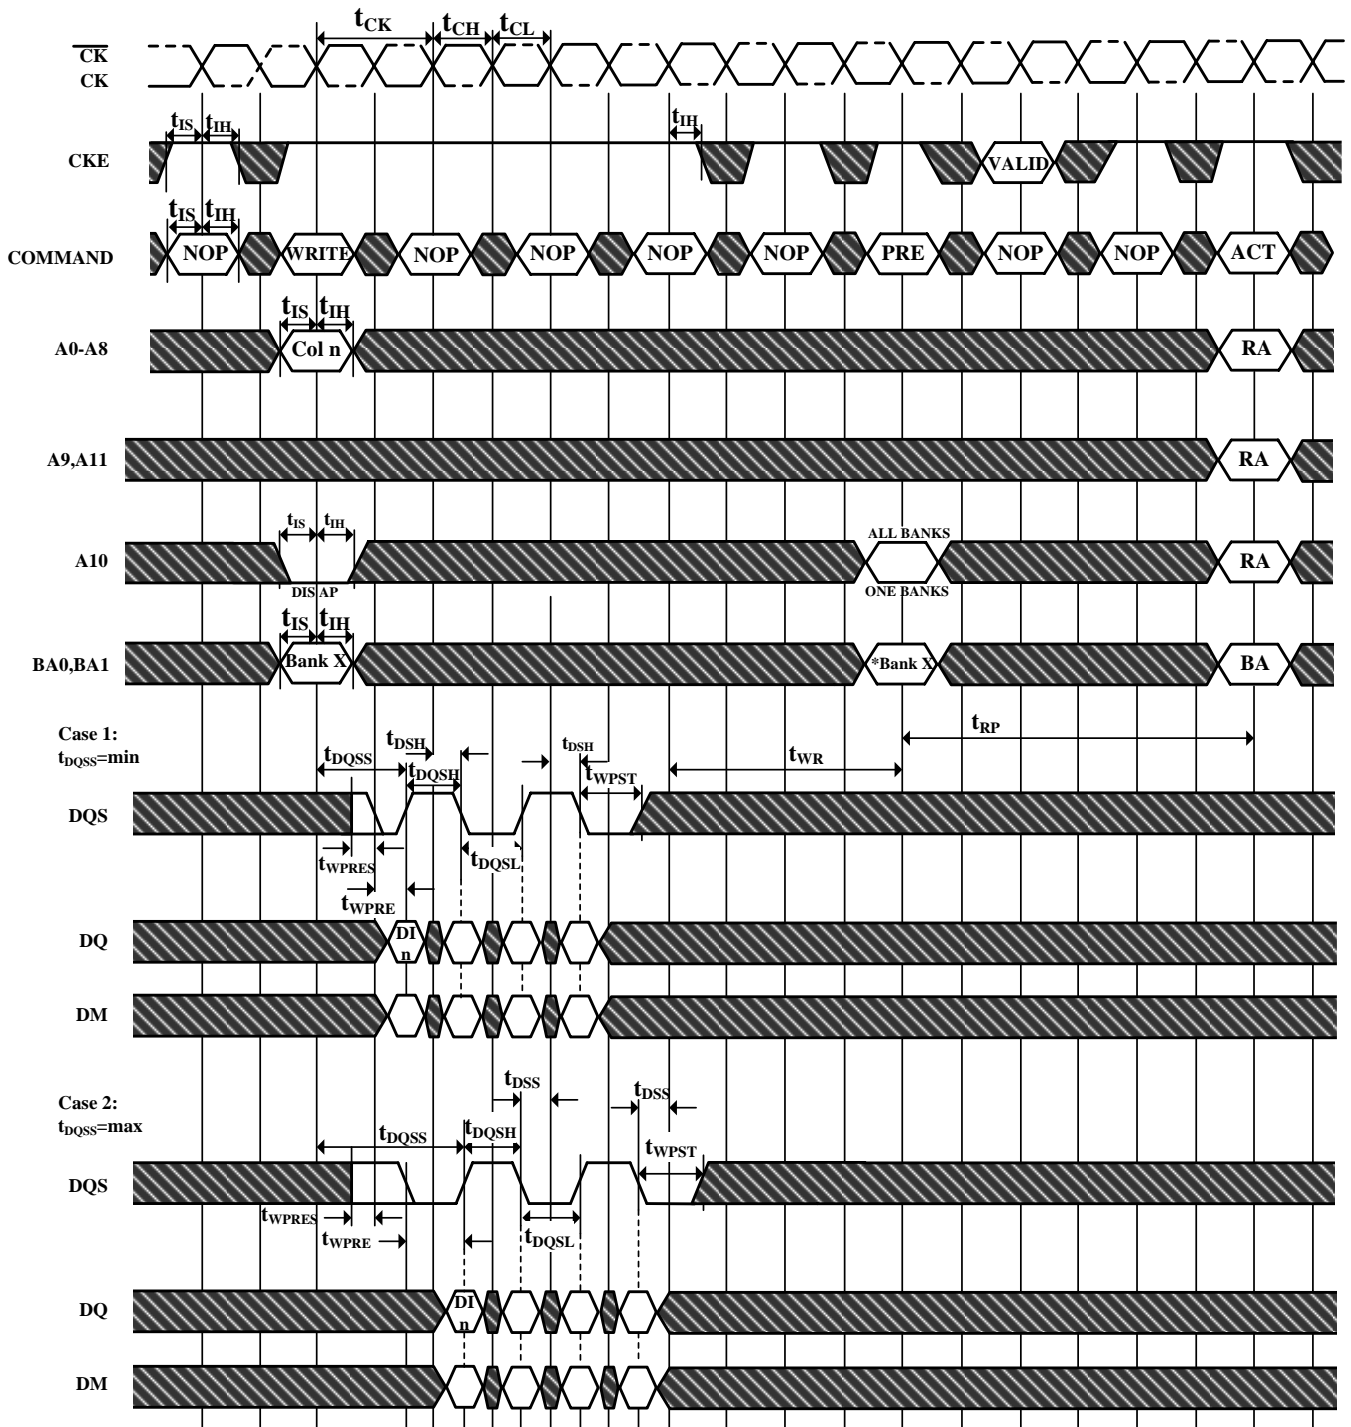

PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address

NOP commands are shown for ease of illustration; other commands may be valid at these times

Note that $t_{RCD} > t_{RCD\ MIN}$ so that the same timing applies if Autoprecharge is enabled (in which case t_{RAS} would be limiting)

 Don't Care

Figure 40. Write without Auto Precharge

DI n = Data In from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data In are provided in the programmed order following DI n

DIS AP = Disable Autoprecharge

*= Don't Care, if A10 is HIGH at this point

PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address, AR = AUTOREFRESH

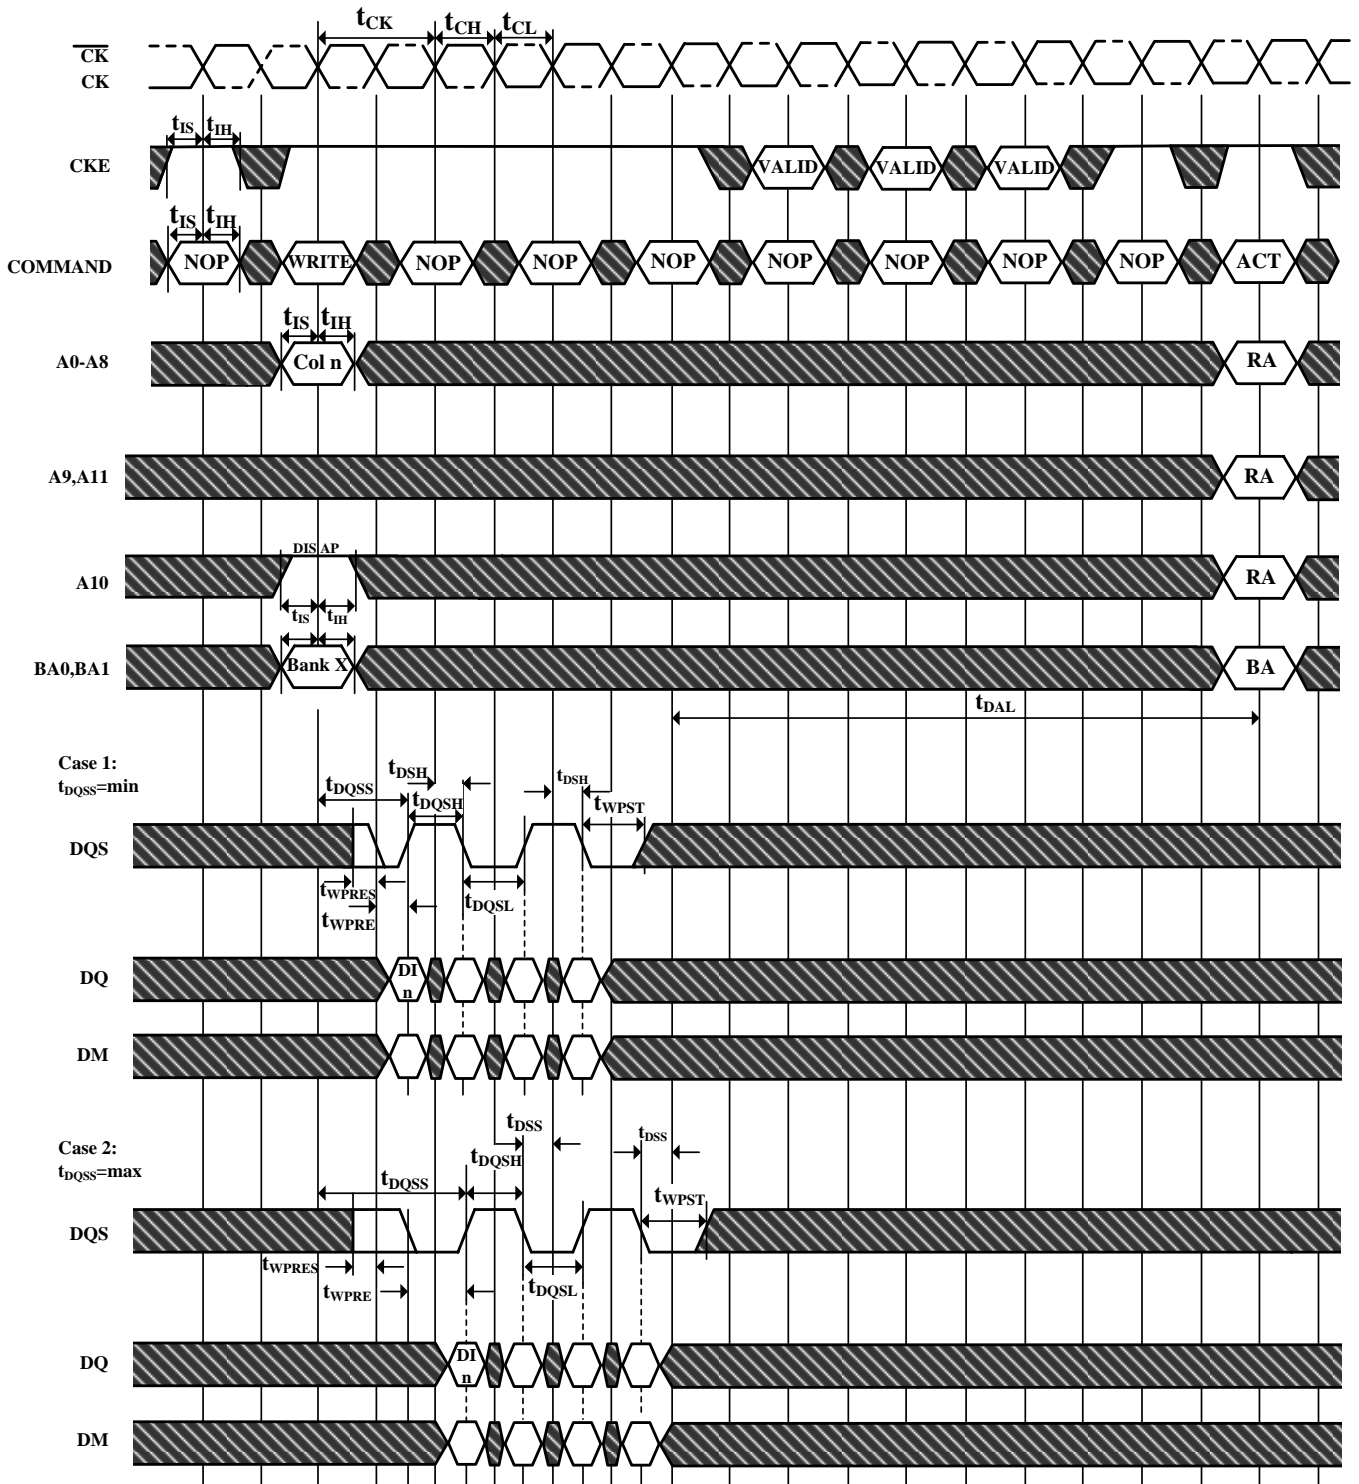

NOP commands are shown for ease of illustration; other commands may be valid at these times

Although t_{DQSS} is drawn only for the first DQS rising edge, each rising edge of DQS must fall within the $\pm 25\%$ window of the corresponding positive clock edge

Precharge may not be issued before t_{RAS} ns after the ACTIVE command for applicable banks

 Don't Care

Figure 41. Write with Auto Precharge

DI n = Data In from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data Out are provided in the programmed order following DI n
