

# DAC1408D650

Dual 14-bit DAC; up to 650 Msps; 2 $\times$ , 4 $\times$  or 8 $\times$  interpolating

Rev. 02 — 11 August 2010

Preliminary data sheet

## 1. General description

The DAC1408D650 is a high-speed 14-bit dual channel Digital-to-Analog Converter (DAC) with selectable 2 $\times$ , 4 $\times$  or 8 $\times$  interpolating filters optimized for multi-carrier WCDMA transmitters.

Because of its digital on-chip modulation, the DAC1408D650 allows the complex pattern provided through lane 0, lane 1, lane 2 and lane 3, to be converted from baseband to IF. The mixing frequency is adjusted via a Serial Peripheral Interface (SPI) with a 32-bit Numerically Controlled Oscillator (NCO) and the phase is controlled by a 16-bit register.

The DAC1408D650 also includes a 2 $\times$ , 4 $\times$  or 8 $\times$  clock multiplier which provides the appropriate internal clocks and an internal regulation to adjust the output full scale current.

The input data format is serial according to JESD204A specification. This new interface has numerous advantages over the traditional parallel one: easy PCB layout, lower radiated noise, lower pin count, self-synchronous link, skew compensation. The maximum number of lanes of the DAC1408D650 is 4 and its maximum serial data rate is 3.125 Gbps.

The Multiple Device Synchronization (MDS) guarantees a maximum skew of one output clock period between several DAC devices. MDS incorporates modes: Master/slave and All slave mode. It guarantees a maximum skew of one output clock period between two devices.

## 2. Features and benefits

- Dual 14-bit resolution
- 650 Msps maximum update rate
- Selectable 2 $\times$ , 4 $\times$  or 8 $\times$  interpolation filters
- Input data rate up to 312.5 Msps
- Very low noise cap free integrated PLL
- 32-bit programmable NCO frequency
- Four JESD204A serial input lanes
- 1.8 V and 3.3 V power supplies
- LVDS compatible clock inputs
- IMD3: 76 dBc;  $f_s = 640$  Msps;  $f_o = 140$  MHz
- ACPR: 71 dBc; two carriers WCDMA;  $f_s = 640$  Msps;  $f_o = 133$  MHz
- Typical 1.24 W power dissipation at 4 $\times$  interpolation, PLL off and 640 Msps
- Power-down mode and Sleep modes
- Differential scalable output current from 1.6 mA to 22 mA
- On-chip 1.25 V reference
- External analog offset control (10-bit auxiliary DACs)
- Internal digital offset control
- Inverse ( $\sin x$ ) /  $x$  function

- Two's complement or binary offset data format
- LMF = 421 or LMF = 211 support
- Differential CML receiver with embedded termination
- Synchronization of multiple DAC devices outputs
- Fully compatible SPI port
- Industrial temperature range from -40 °C to +85 °C
- Integrated PLL can be bypassed
- Embedded complex modulator

### 3. Applications

- Wireless infrastructure: LTE, WiMAX, GSM, CDMA, WCDMA, TD-SCDMA
- Communication: LMDS/MMDS, point to point
- Direct Digital Synthesis (DDS)
- Broadband wireless systems
- Digital radio links
- Instrumentation
- Automated Test Equipment (ATE)

### 4. Ordering information

**Table 1. Ordering information**

Type number	Package			Version
	Name	Description		
DAC1408D650HN/C1	HVQFN64	plastic thermal enhanced very thin quad flat package; no leads; 64 terminals; body 9 × 9 × 0.85 mm; exposed die pad		SOT804-3

DAC1408D; up to 650 Msps; 2 $\times$ , 4 $\times$  or 8 $\times$  interpolating with JESD204A

AGND	37	G	analog ground
V <sub>DDA(1V8)</sub>	38	P	analog supply voltage 1.8 V
V <sub>DDA(1V8)</sub>	39	P	analog supply voltage 1.8 V
AGND	40	G	analog ground
CLKINP	41	I	clock input
CLKINN	42	I	complementary clock input
AGND	43	G	analog ground
V <sub>DDA(1V8)</sub>	44	P	analog supply voltage 1.8 V
MDS_P	45	I/O	multi-devices synchronization
MDS_N	46	I/O	complementary multi-devices synchronization
V <sub>DDD(1V8)</sub>	47	P	digital supply voltage 1.8 V
n.c.	48	-	not connected
V <sub>DDD(1V8)</sub>	49	P	digital supply voltage 1.8 V
SYNC_OUTN	50	O	synchronization request to transmitter, complementary output
SYNC_OUTP	51	O	synchronization request to transmitter

**Table 2.** Pin description ...continued

Symbol	Pin	Type <sup>[1]</sup>	Description
VIN_N0	52	I	serial interface lane 0 negative input
VIN_P0	53	I	serial interface lane 0 positive input
V <sub>DDD(1V8)</sub>	54	P	digital supply voltage 1.8 V
VIN_P1	55	I	serial interface lane 1 positive input
VIN_N1	56	I	serial interface lane 1 negative input
VIN_N2	57	I	serial interface lane 2 negative input
VIN_P2	58	I	serial interface lane 2 positive input
V <sub>DDD(1V8)</sub>	59	P	digital supply voltage 1.8 V
VIN_P3	60	I	serial interface lane 3 positive input
VIN_N3	61	I	serial interface lane 3 negative input
n.c.	62	-	not connected
n.c.	63	-	not connected
JTAG	64	I	JTAG test mode select (must be grounded)
GND	H <sup>[2]</sup>	G	ground

[1] P: power supply; G: ground; I: input; O: output.

[2] H = heatsink (exposed die pad to be soldered to GND. A minimum of 81 thermal vias are required)

## 7. Limiting values

**Table 3.** Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>DDA(3V3)</sub>	analog supply voltage (3.3 V)		[1] -0.5	+4.6	V
V <sub>DDA(1V8)</sub>	analog supply voltage (1.8 V)		[2] -0.5	+2.5	V
V <sub>DDD</sub>	digital supply voltage		[2] -0.5	+2.5	V
T <sub>stg</sub>	storage temperature		-55	+150	°C
T <sub>amb</sub>	ambient temperature		-40	+85	°C
T <sub>j</sub>	junction temperature		-40	+125	°C

[1] The supply voltage V<sub>DDA(3V3)</sub> may have any value between -0.5 V and +4.6 V provided that the supply voltage differences  $\Delta V_{CC}$  are respected.

[2] The supply voltages V<sub>DDA(1V8)</sub> and V<sub>DDD</sub> may have any value between -0.5 V and +2.5 V provided that the supply voltage differences  $\Delta V_{CC}$  are respected.

## 8. Thermal characteristics

**Table 4.** Thermal characteristics

Symbol	Parameter	Conditions	Typ	Unit
R <sub>th(j-a)</sub>	thermal resistance from junction to ambient		[1] 18.7	K/W
R <sub>th(j-c)</sub>	thermal resistance from junction to case		[1] <tbd>	K/W

[1] In compliance with JEDEC test board, in free air.

## 9. Characteristics

**Table 5. Characteristics**

$V_{DDA(1V8)} = V_{DDD} = 1.7 \text{ V to } 1.9 \text{ V}$ ;  $V_{DDA(3V3)} = 3.0 \text{ V to } 3.6 \text{ V}$ ; AGND and GND are shorted together;  $T_{amb} = -40 \text{ }^{\circ}\text{C to } +85 \text{ }^{\circ}\text{C}$ ; typical values measured at  $V_{DDA(1V8)} = V_{DDD} = 1.8 \text{ V}$ ;  $V_{DDA(3V3)} = 3.3 \text{ V}$ ;  $T_{amb} = +25 \text{ }^{\circ}\text{C}$ ;  $R_L = 50 \Omega$ ;  $I_{O(fs)} = 20 \text{ mA}$ ; maximum sample rate; PLL off unless otherwise specified.

Symbol	Parameter	Conditions	Test <sup>[1]</sup>	Min	Typ	Max	Unit

[1] D = guaranteed by design; C = guaranteed by characterization; I = 100 % industrially tested.

[2] CLKINP/CLKINN inputs are at differential LVDS levels. An external termination resistor with a value of between  $80\text{ }\Omega$  and  $120\text{ }\Omega$  (see [Figure 16](#)) should be connected across the pins.

[3]  $|V_{gpd}|$  represents the ground potential difference voltage. This is the voltage that results from current flowing through the finite resistance and the inductance between the receiver and the driver circuit ground voltage.

[4] Vin\_p and Vin\_n inputs are differential CML inputs. There are terminated internally to  $V_{tt}$  via  $50\text{ }\Omega$  (see [Figure 4](#)).

[5] SYNC\_OUTP/SYNC\_OUTN outputs are differential LVDS outputs. They must be terminated by a resistor with a value of between  $80\text{ }\Omega$  and  $120\text{ }\Omega$ .

[6] IMD3 rejection with  $-6\text{ dBFS/tone}$ .

## 10. Application information

### 10.1 General description

The DAC1408D650 is a dual 14-bit DAC operating up to 650 Msps. With a maximum input data rate of up to 312.5 Msps and a maximum output sampling rate of 650 Msps, the DAC1408D650 allows more flexibility for wide bandwidth and multi-carrier systems. Combined with its quadrature modulator and its 32-bit NCO, the DAC1408D650 simplifies the frequency selection of the system. This is also possible because of the 2 $\times$ , 4 $\times$  or 8 $\times$  interpolation filters that remove undesired images.

DAC1408D650 supports the following JESD204A key features:

- 8-bit/10-bit decoding
- Code group synchronization
- interlane alignment
- $I + x^{14} + x^{15}$  scrambling polynomial
- Character replacement
- TX/RX synchronization management via SYNC signals
- Multiple Converter Device Alignment-Multiple Lanes (MCDA-ML) device

DAC1408D650 can be interfaced with any logic device that features high speed SERDES functionality. This macro is now widely available in FPGA from different vendors. Standalone SERDES ICs can also be used.

To enhance the intrinsic board layout simplification of the JESD204A standard, NXP includes polarity swapping for each of the lanes and additionally offers lane swapping. Each physical lane can be configured as being logically lane0, lane1, lane2 or lane3.

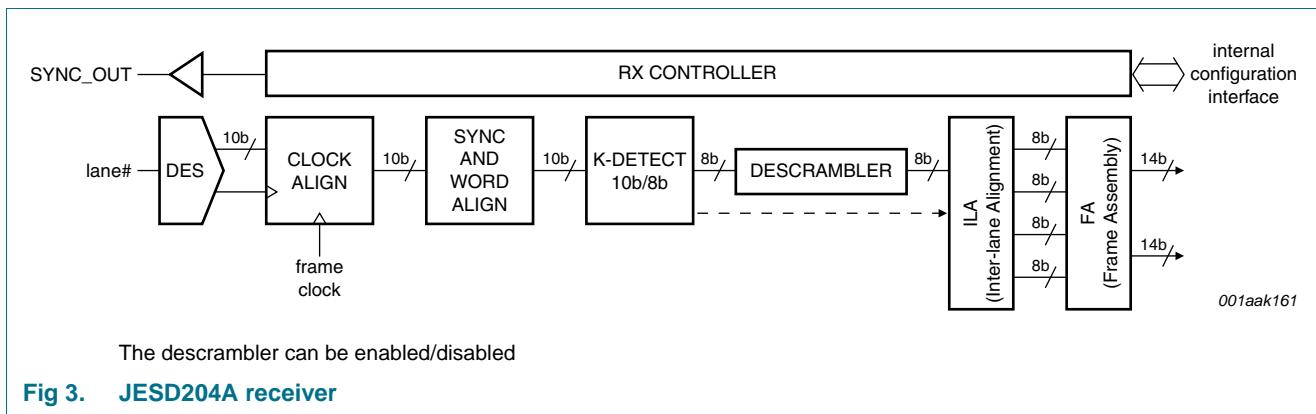

This device is MCDA-ML compliant, offering interlane alignment between several devices. Samples alignment between devices is maintained up to output level because of an NXP proprietary mechanism. One device is configured as the master and all the others are configured as slaves. These will automatically align their output samples to the master ones. Therefore, a system with several DAC1408D650 can produce data with a guaranteed alignment of less than 1 DAC output clock period.

Each DAC generates two complementary current outputs on pins IOUTAP/IOUTAN and IOUTBP/IOUTBN. This provides a full-scale output current of up to 20 mA. An internal reference is available for the reference current which is externally adjustable using pin VIRES.

The DAC1408D650 must be configured before operating. Therefore, it features an SPI slave interface to access internal registers. Some of these registers also provide information about the JESD204A interface status.

The DAC1408D650 requires both 3.3 V and 1.8 V. 1.8 V has separate digital and analog power supply pins. The clock input is LVDS compliant.

## 10.2 JESD204A receiver

The JEDEC204A defines the following parameters:

L is the number of lanes per link

M is the number of converters per device

F is the number of bytes per frame clock period

The DAC1408D650 supports both LMF = 421 and LMF = 211. The current setting is configurable via the SPI registers interface.

The complete Digital Layer Processing (DLP) adds a variable delay on each lane path. This is mainly because of the interlane alignment.

**Table 6. Digital Layer Processing Latency**

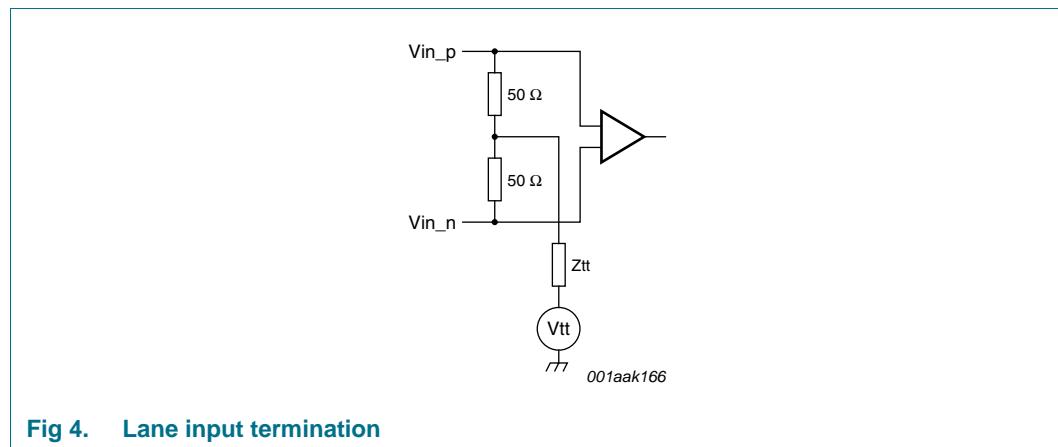

Symbol	Parameter	Conditions	Test <sup>[1]</sup>	Min	Typ	Max	Unit
$t_d$	delay time	digital layer processing delay	D	13	-	28	Cycle <sup>[2]</sup>

[1] D = guaranteed by design.

[2] Frame clock cycle.

### 10.2.1 Lane input

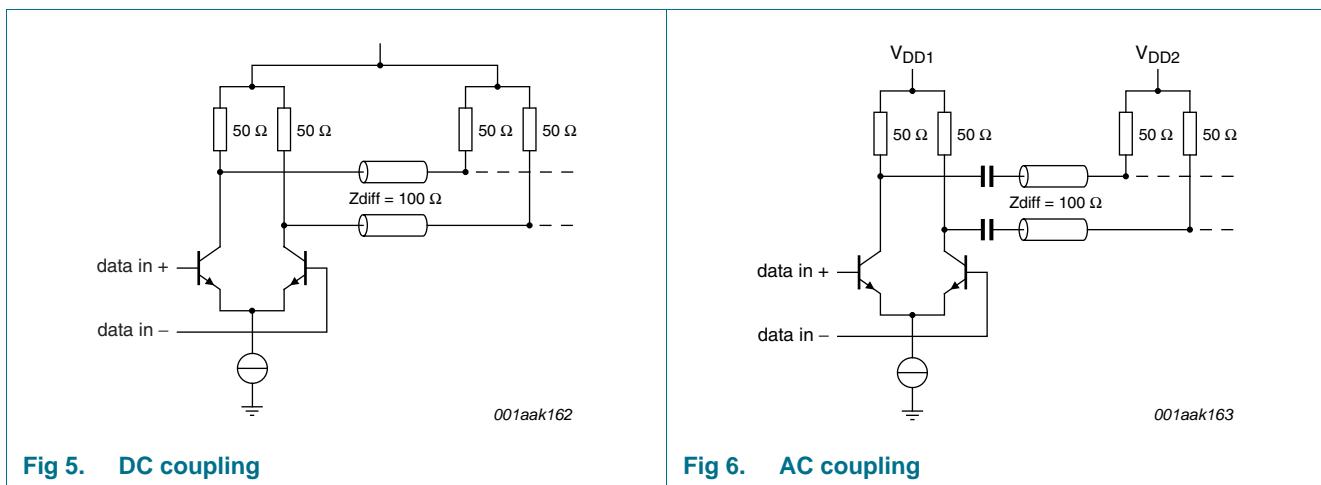

Each lane is CML compliant. It is terminated to a common voltage with an integrated 50  $\Omega$  resistor.

**Fig 4. Lane input termination**

The common mode voltage is programmable. See [Table 76 on page 55](#) for the register value.

DC coupling is only possible if both the DAC and the transmitter have the same common-mode voltage. If this is not the case AC coupling is required.

**Fig 5. DC coupling**

**Fig 6. AC coupling**

The deserializer performs the incoming data clock recovery and also the serial to parallel conversion. Therefore, each lane includes its own PLL that must first lock.

Then the clock alignment module transfers the data from the regenerated clock to the frame clock domain. The frequency of both clocks is the same but the phase relation between the clocks is unknown.

### 10.2.2 Sync and word align

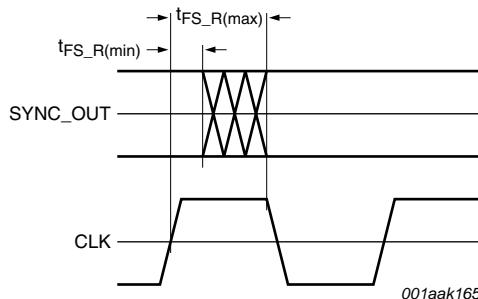

As stated in JESD204A, the transmitter and the receiver first have to synchronize. This is achieved through SYNC\_OUT signals and a SYNC pattern (K28.5 symbol). The receiver (i.e. DAC1408D650) first drives its SYNC outputs. The SYNC signal/pattern is continuously sent until the receiver deasserts the SYNC signal.

The lane processing makes use of the SYNC-patterns to synchronize the datastream, determine the initial running disparity and extract the 10-bit word from the incoming datastream (word-alignment).

The SYNC signal is also used during normal operation by the DAC1408D650 to request a link re-initialization. This occurs when the 8b/10b module loses synchronization.

The SYNC\_OUT signal conforms to LVDS signaling. Its common mode voltage and its differential peak-to-peak amplitude (see [Table 78](#)) can be programmed using registers.

SYNC\_OUT is synchronous with the frame clock.

**Fig 7. SYNC\_OUT timing**

**Table 7. SYNC\_OUT timing**

Symbol	Parameter	Conditions	Test <sup>[1]</sup>	Min	Typ	Max	Unit
$t_d$	delay time	frame clock to sync	C	<tbd>	-	<tbd>	ns

[1] C = guaranteed by characterization.

### 10.2.3 Comma detection and word align

This stage monitors the datastream for code characters (comma detection), decodes the words to bytes (octets) and performs optional character replacement as part of frame/lane alignment monitoring and correction. This module provides the required control signals to the RX-controller and ILA.

This module decodes the 10-bit words into 8-bit words (octets). The decoding table is specified in the IEEE Std.802.3-2005 specification. During decoding, the disparity is calculated according to the disparity rules mentioned in the same specification IEEE Std.802.3-2005. When the disparity counter is more than +2 or less than -2, an error will be generated.

The following comma symbols are detected during data transmission irrespective of the running disparity:

/K/=K28.5  
/F/=K28.7  
/A/=K28.3  
/R/=K28.0  
/Q/=K28.4

A flag is sent to the control interface to reflect detected commas in registers.

The following flags are also triggered according to the following definitions:

- VALID: a code group that is found in the column of the 8b/10b decoding tables according to the current running disparity.
- DISPARITY ERROR: The received code group exists in the 8b/10b decoding table, but is not found in the proper column according to the current running disparity.
- NOT-IN-TABLE ERROR: The received code group is not found in the 8b/10b decoding table for either disparity.
- INVALID: a code group that either shows a disparity error or that does not exist in the 8b/10b decoding table.

DAC1408D650 supports character replacement whatever the state of the descrambler. When scrambling is not active, the received K28.3 /A/ or K28.7 /F/ will be replaced by the previous sample. When scrambling is active, the corresponding data octet D28.3 (0xC) or D28.7 (0xFC) will be used.

#### 10.2.4 Descrambler

The used descrambler is the 16-bit parallel self-synchronous descrambler based on the polynomial  $1 + x^{14} + x^{15}$ . This processing can be turned off.

#### 10.2.5 Interlane alignment

This feature removes strict PCB design skew compensation between the lanes.

##### 10.2.5.1 Single device operation

This module handles the alignment of the four data streams. Because of interlane skew and each PLL per lane concept, these alignment characters may be received at different times by the receivers. After the synchronization period, the lock signal will be high. This enables the receiving of K28.3 /A/ characters.

The /A-characters provided in the initial alignment sequence are then used to align the four data streams. With the bit field sel\_ilal (two bits) (refer to [Table 87 "ILA\\_CNTRL register \(address 07h\) bit description"](#)), one can select the used K28.3 /A/ symbol ("00"  $\Rightarrow$  use the 1st /A/ symbol, "01"  $\Rightarrow$  use the 2nd /A/ symbol, "10"  $\Rightarrow$  use the 3rd /A/ symbol, "11"  $\Rightarrow$  use the 4th /A/ symbol) during the initial lane alignment. When all receivers have received their first selected /A/, they start propagating the received data to the frame assembly module at the same point in time.

This module can compensate up to +7/-7 frame clock period misalignment between the lanes.

When initial lane alignment is not supported, the manual alignment mode can be used.

After the initial ILA sequence, the lane alignment monitoring starts. When a K28.3 /A/ symbol is received among the user data:

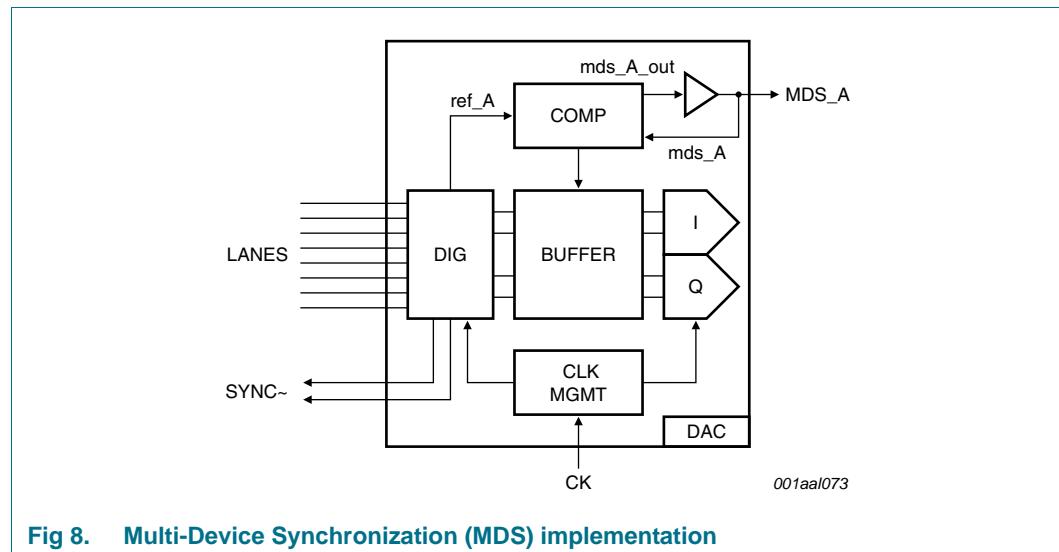

- its position is compared to the value of the alignment monitor counter
- if two successive K28.3 /A/ symbols have been received at a wrong position, a realignment takes place

- if the buffers are empty or overflow, this will be indicated by the registers buff\_err\_In0 to buff\_err\_In3

#### 10.2.5.2 Multi-device operation

DAC1408D650 implements a multi-device interlane alignment that guarantees a skew of less than one output period between them.

Two modes are available: Master/slave and All slave. Both make use of the MDS\_P and MDS\_N pins.

Each DAC device of the system generates its own reference (ref\_A on [Figure 8](#)).

If configured as slave, an early-late comparator compares the internal reference with the external reference provided by the MDS pins. The comparator controls an internal buffer that is used to delay the samples.

### 10.2.5.3 Master/slave mode

The external reference is provided by one of the DACs (the master DAC), which has to be configured to be able to do this. The others are set to Slave mode.

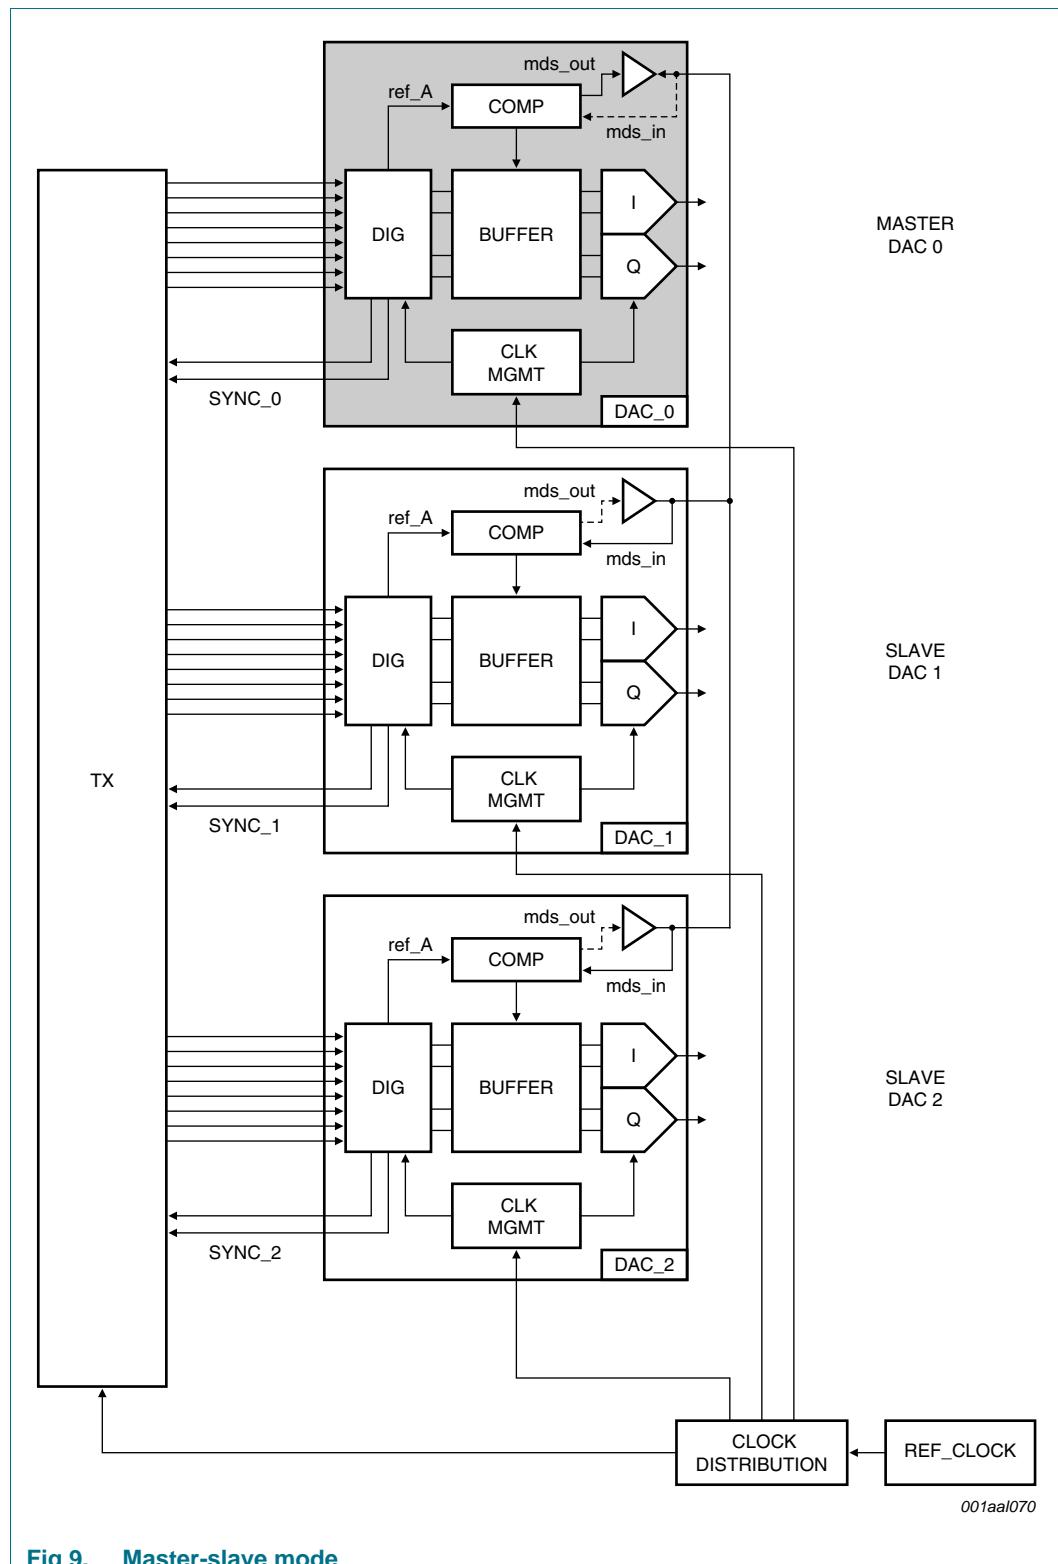

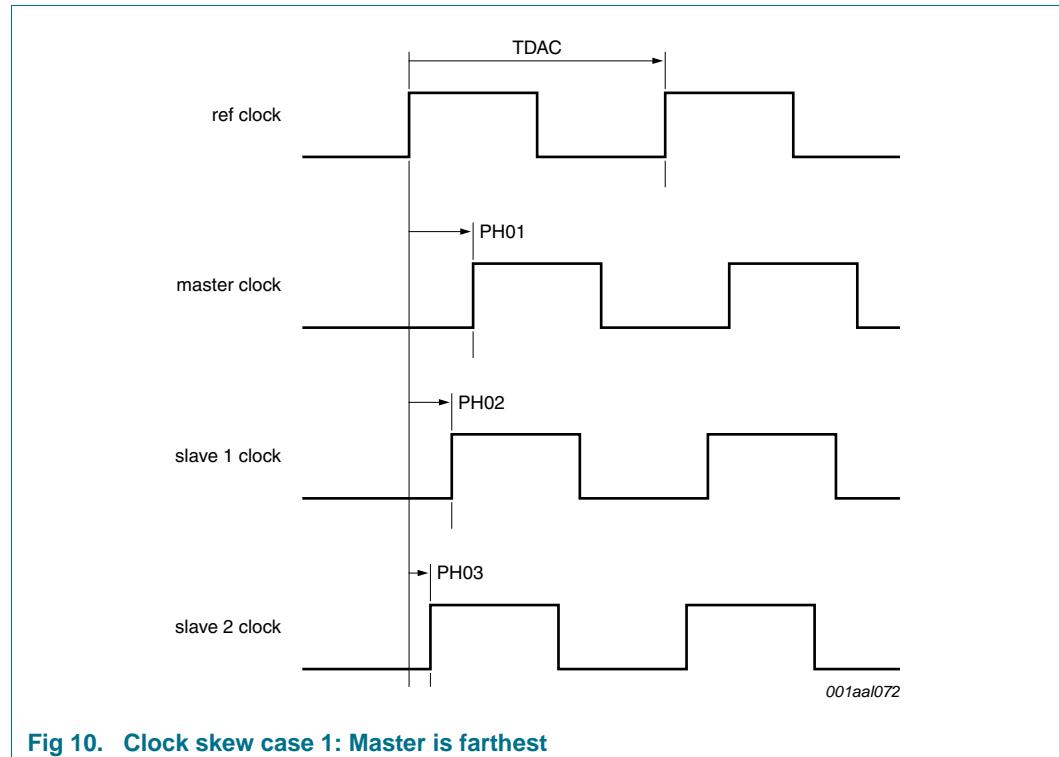

Fig 9. Master-slave mode

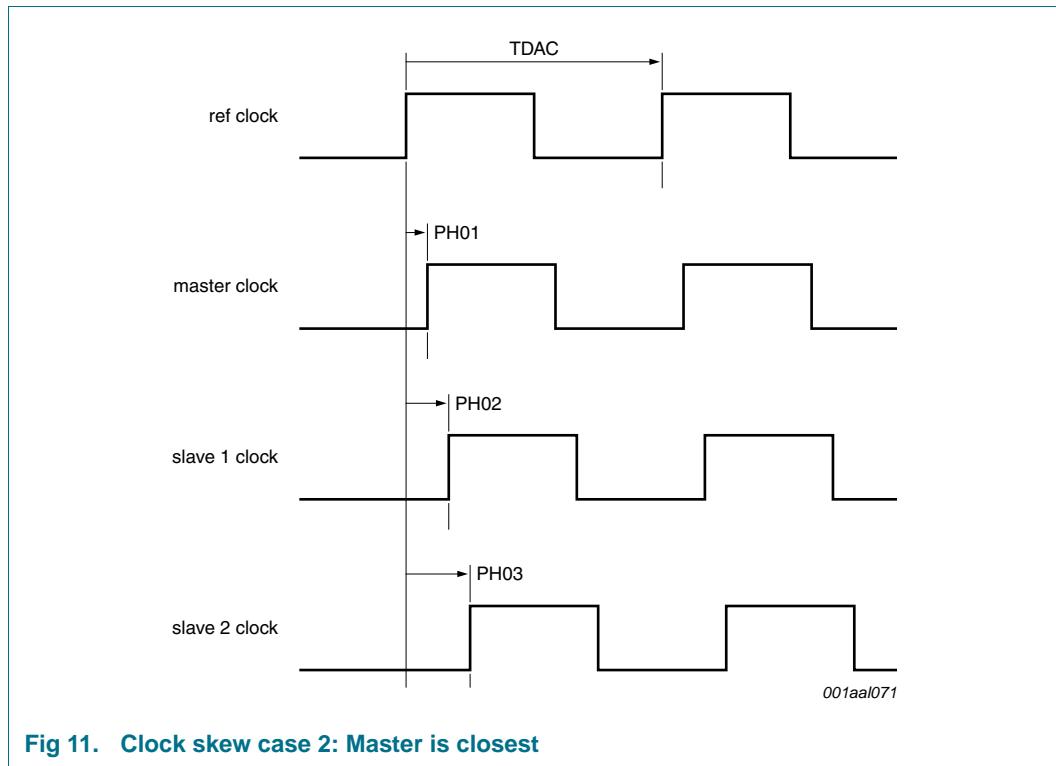

The MDS signal generated by the master DAC must reach all slaves within one DAC output clock period. This induces PCB layout constraints for the MDS signal and also for the clock distribution. Because trace lengths differ, the clock edges will reach each of the DACs at different times.

**Fig 10. Clock skew case 1: Master is farthest**

The worst case clock skew is given by  $\delta t_I = PH01 - PH03$ , where  $PH0x$  represents the trace delay and also the clock skew at the output of the clock generator.

The maximum allowable trace delay for the MDS signal is given by  $\Delta t = TDAC - \delta t_I$ .

The worst case clock skew is given by  $\delta t_2 = PH03 - PH01$ .

The minimum allowable trace delay for the MDS signal is given by  $\Delta t = \delta t_2$ .

In real applications, the master DAC can be anywhere and both conditions must be satisfied:  $\delta t_2 < \Delta t_{mds} < TDAC - \delta t_1$ .

Example:

- clock generator skew =  $\pm 80$  ps
- FR4 substrate  $\Rightarrow 15$  cm/ns delay
- clock trace length difference = 3 cm and 4 cm
- Output sampling rate = 650 Msps

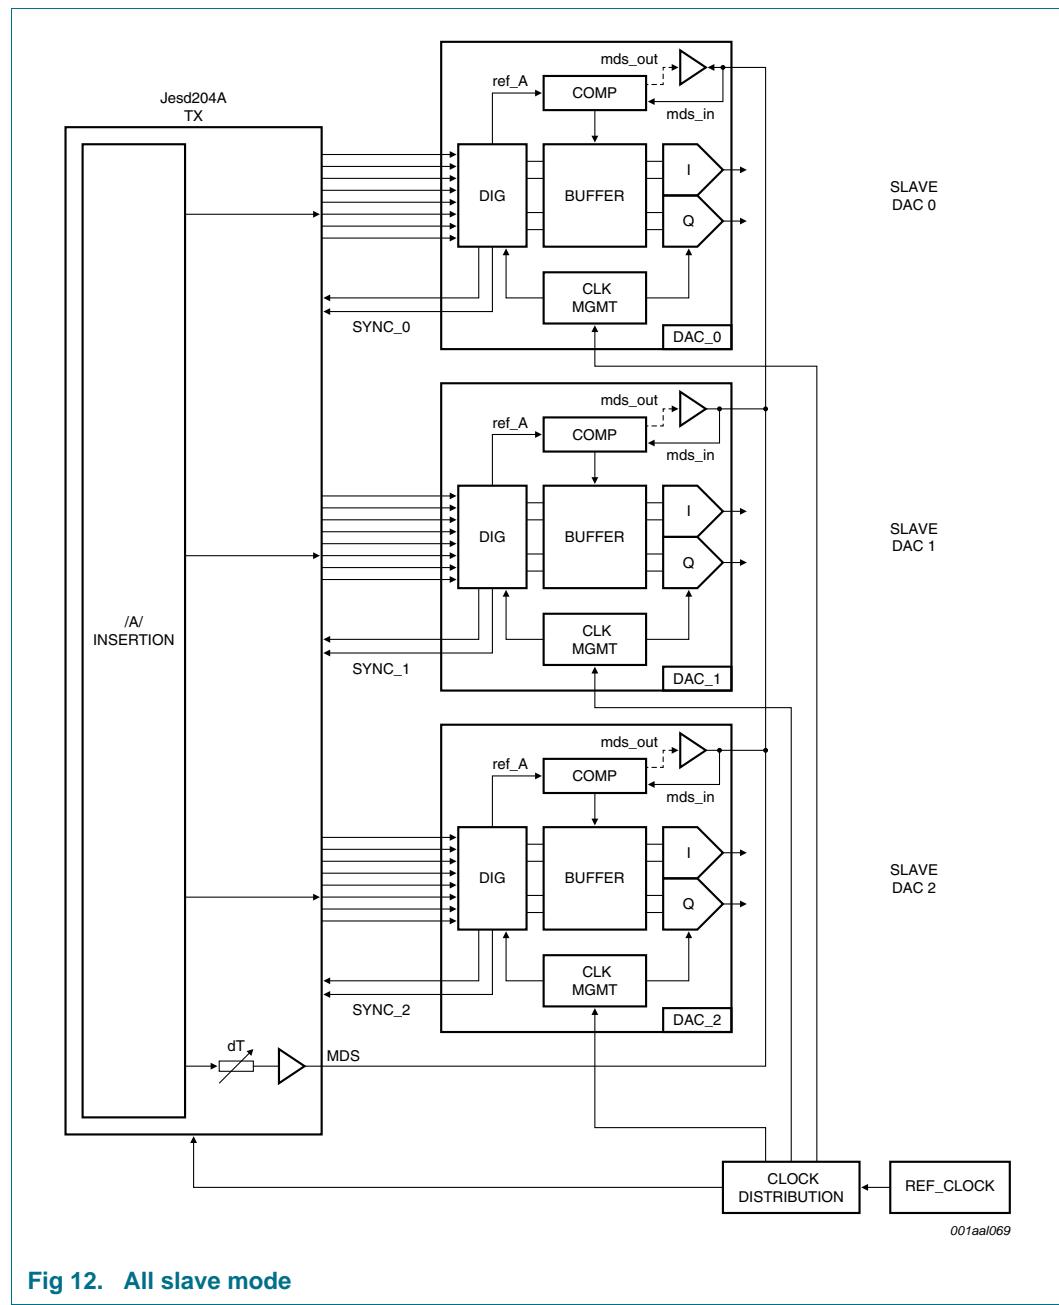

$$\Rightarrow 200 \text{ ps} + 80 \text{ ps} < \Delta t_{mds} < 1538 \text{ ps} - (266 \text{ ps} + 80 \text{ ps})$$

$$\Rightarrow 280 \text{ ps} < \Delta t_{mds} < 1192 \text{ ps}$$

$$\Rightarrow 4.2 \text{ cm} < L_{mds} < 17.8 \text{ cm}$$

#### 10.2.5.4 All slave mode

The external reference is provided by the JESD204A transmitter. All DACs are configured in Slave mode.

**Fig 12. All slave mode**

The MDS signal is now driven from the transmitter. It is generated at the end of the interlane alignment phase (see the JESD204A standard for details).

The transmitter must also compensate for the DAC latency. Although the DAC has an internal samples delay line, it cannot handle large delays.

In this mode, PCB layout is also important. The following delay equation applies:

$$\delta t < \Delta t_{mds} < TDAC - \delta t, \text{ where } \delta t \text{ is the clock skew considered close to DAC pins.}$$

### 10.2.6 Frame assembly

DAC1408D650 supports only  $/F = 1$ , which means that every frame clock period carries one byte per lane. Frame assembly combines the octet of lane\_0 with the six MSB bits of lane\_1 and reassemble the original 14-bit sample. The same is done for lane\_2 and lane\_3. Tail bits are dropped.

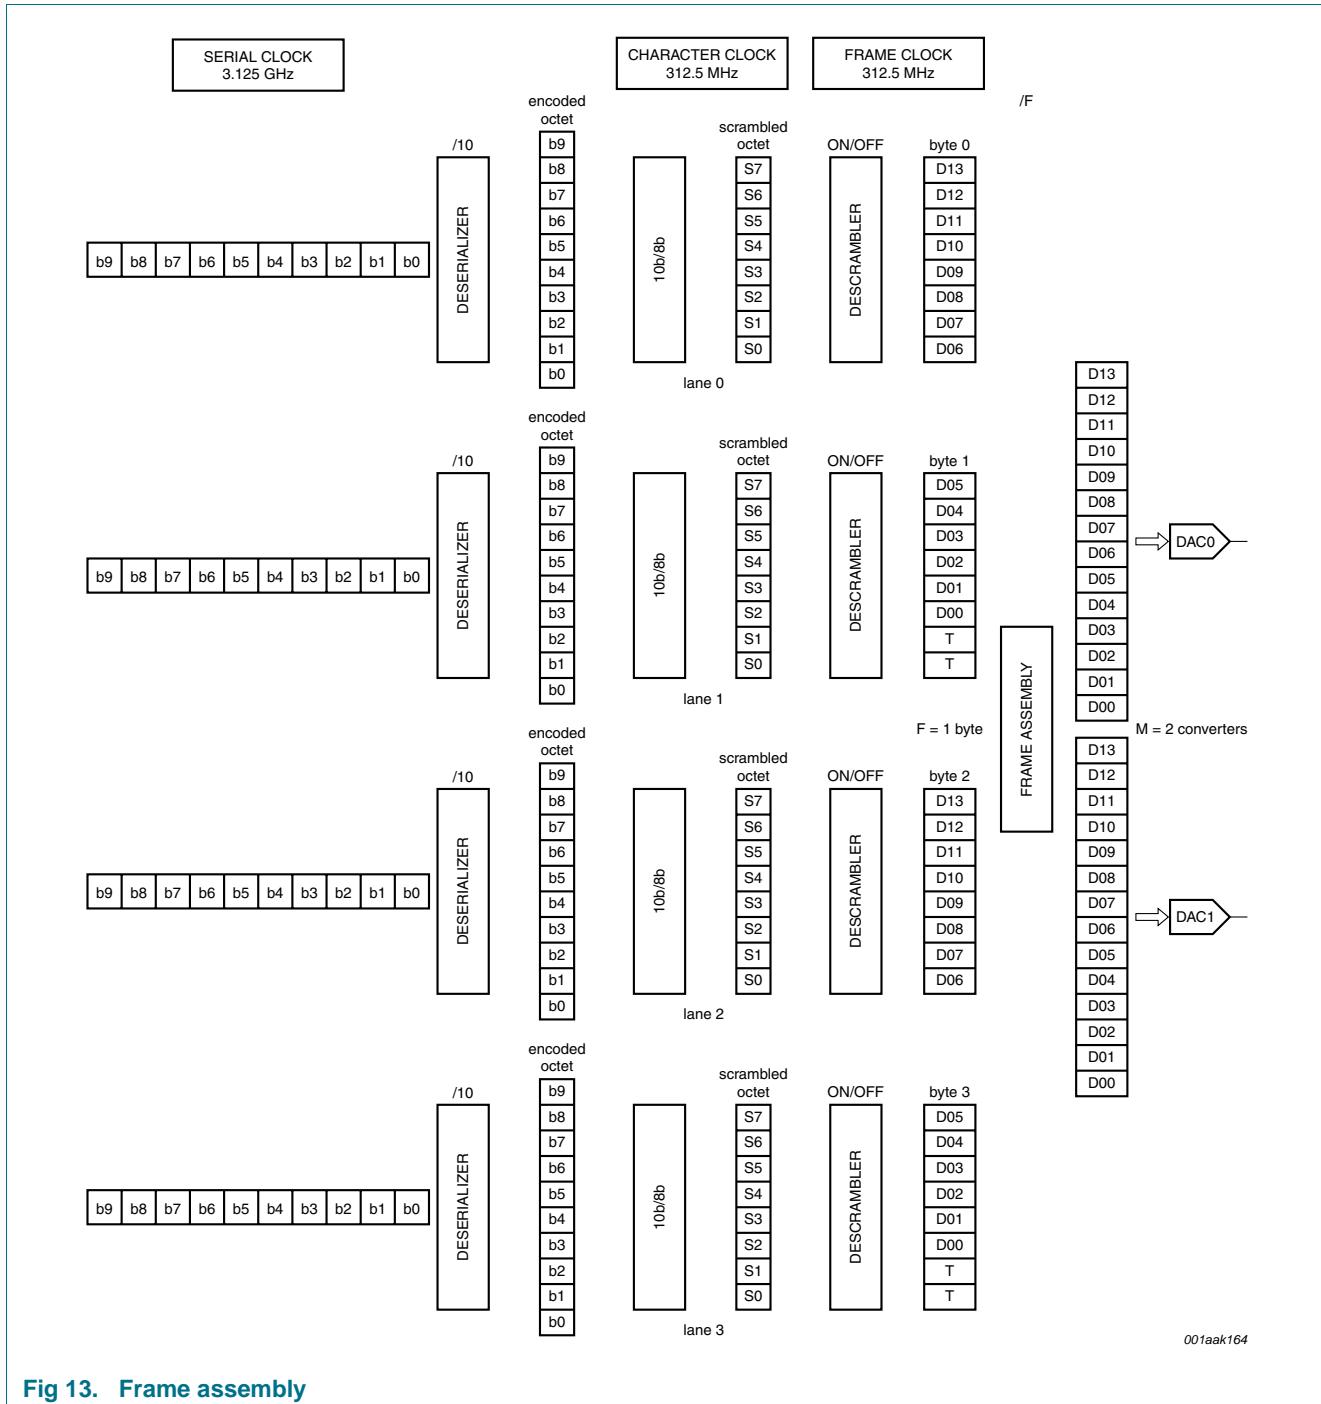

The frame assembler also handles error previously triggered.

If scrambling is enabled:

If a nit\_err (not in table error) or kout\_unexp (unexpected control character) occurs in lane\_0 and/or lane\_1, the previous 14-bit sample is repeated twice for I (lane\_0, lane\_1). The same is done for Q (lane\_2, lane\_3).

If scrambling is disabled:

if a nit\_err (not in table error) or kout\_unexp (unexpected control character) occurs in lane\_0 and/or lane\_1, the previous 14-bit sample will be repeated once for I (lane\_0, lane\_1). The same is done for Q (lane\_2, lane\_3).

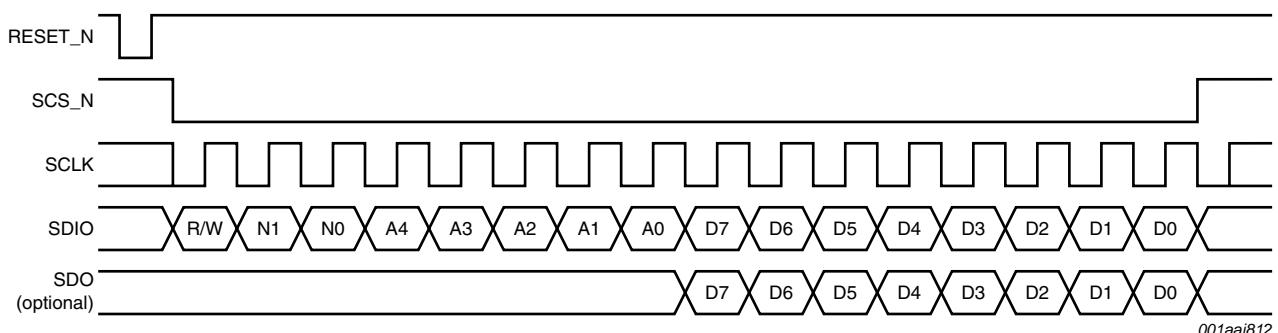

## 10.3 Serial Peripheral Interface (SPI)

### 10.3.1 Protocol description

The DAC1408D650 serial interface is a synchronous serial communication port allowing easy interfacing with many industry microprocessors. It provides access to the registers that define the operating modes of the chip in both Write mode and Read mode.

This interface can be configured as a 3-wire type (SDIO as bidirectional pin) or a 4-wire type (SDIO and SDO as unidirectional pin, input and output port respectively). In both configurations, SCLK acts as the serial clock and SCS\_N acts as the serial chip select bar.

Each read/write operation is sequenced by the SCS\_N signal and enabled by a LOW assertion to drive the chip with two bytes to five bytes, depending on the content of the instruction byte (see [Table 9](#)).

R/W indicates the mode access, (see [Table 8](#)):

**Fig 14. SPI protocol**

**Table 8. Read or Write mode access description**

R/W	Description
0	Write mode operation
1	Read mode operation

In [Table 9](#) below, N1 and N0 indicate the number of bytes transferred after the instruction byte.

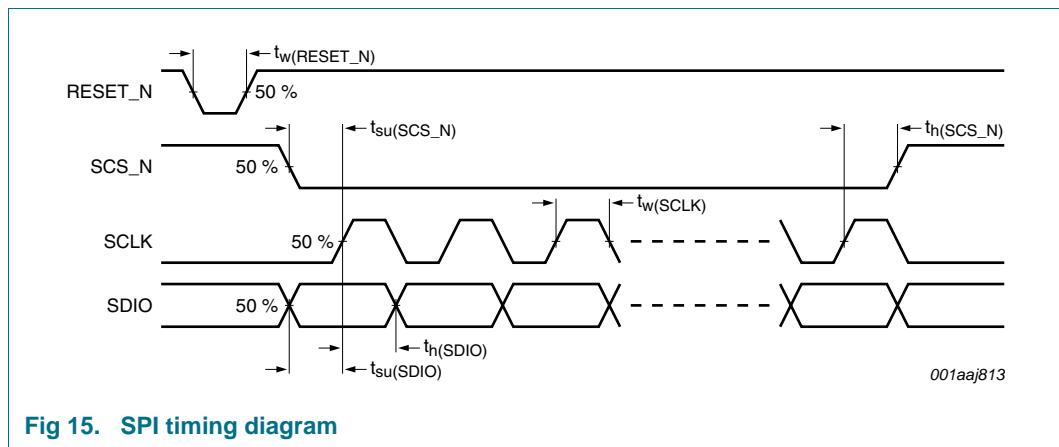

**Table 9. Number of bytes to be transferred**

N1	N0	Number of bytes transferred
0	0	1
0	1	2
1	0	3
1	1	4

A[4:0] indicates which register is being addressed. In case of a multiple transfer, this address points to the first register accessed and is internally decreased after each following data phase.

### 10.3.2 SPI timing description

The SPI interface can operate at a frequency of up to 15 MHz. The SPI timing is shown in [Figure 15](#).

**Fig 15. SPI timing diagram**

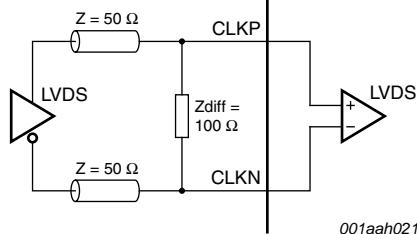

The SPI timing characteristics are given in [Table 10](#).

**Table 10. SPI timing characteristics**

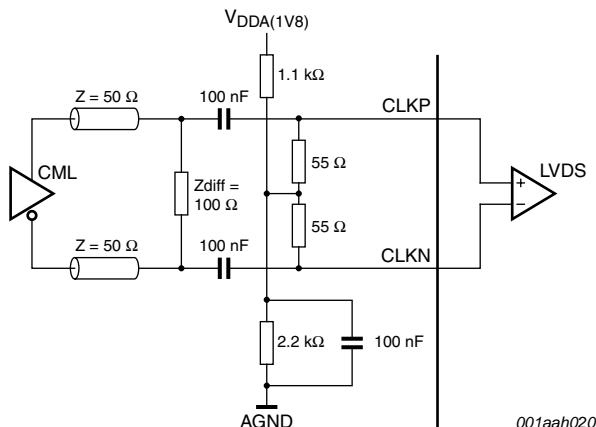

Symbol	Parameter	Min	Typ	Max	Unit
$f_{SCLK}$	SCLK frequency	-	-	15	MHz
$t_w(SCLK)$	SCLK pulse width	30	-	-	ns
$t_{su}(SCS\_N)$	SCS_N set-up time	20	-	-	ns
$t_h(SCS\_N)$	SCS_N hold time	20	-	-	ns
$t_{su}(SDIO)$	SDIO set-up time	10	-	-	ns
$t_h(SDIO)$	SDIO hold time	5	-	-	ns
$t_w(RESET\_N)$	RESET_N pulse width	30	-	-	ns

## 10.4 Clock input

The DAC1408D650 has one differential clock input, CLKINN/CLKINP.

**Fig 16. LVDS clock configuration**

**Fig 17. Interfacing CML to LVDS**

The DAC1408D650 can operate with a clock frequency up to 312.5 MHz or up to 650 MHz if the internal PLL is bypassed. The clock input can be LVDS (see [Figure 16](#)) but it can also be interfaced with CML (see [Figure 17](#)).

During the reset phase (RESET\_N asserted), the clock must be stable and running. This ensures a proper reset of the complete device.

The device has no embedded power-on-reset feature. Driving the RESET\_N pin to set the device to its default state is mandatory.

## 10.5 FIR filters

The three interpolation FIR filters have a stop band attenuation of at least 80 dBc and a pass band ripple of less than 0,0005 dB.

**Table 11. Interpolation filter coefficients**

First interpolation filter			Second interpolation filter			Third interpolation filter		
Lower	Upper	Value	Lower	Upper	Value	Lower	Upper	Value
H(1)	H(55)	-4	H(1)	H(23)	-2	H(1)	H(15)	-39
H(2)	H(54)	0	H(2)	H(22)	0	H(2)	H(14)	0
H(3)	H(53)	13	H(3)	H(21)	17	H(3)	H(13)	273
H(4)	H(52)	0	H(4)	H(20)	0	H(4)	H(12)	0
H(5)	H(51)	-34	H(5)	H(19)	-75	H(5)	H(11)	-1102

H(22)	H(34)	0	-	-	-	-	-	-
H(23)	H(33)	3671	-	-	-	-	-	-
H(24)	H(32)	0	-	-	-	-	-	-
H(25)	H(31)	-6642	-	-	-	-	-	-
H(26)	H(30)	0	-	-	-	-	-	-
H(27)	H(29)	20756	-	-	-	-	-	-
H(28)	-	32768	-	-	-	-	-	-

## 10.6 Quadrature modulator and Numerically Controlled Oscillator (NCO)

The quadrature modulator allows the 14-bit I and Q data to be mixed with the carrier signal generated by the NCO.

The frequency of the NCO is programmed over 32 bits and the sign of the sine component can be inverted in order to operate positive or negative, lower or upper single sideband up-conversion.

### 10.6.1 NCO in 32-bit

When using the NCO, the frequency can be set by the four registers FREQNCO\_LSB, FREQNCO\_LISB, FREQNCO\_UISB and FREQNCO\_MSB over 32 bits.

The frequency for the NCO in 32-bit is calculated as follows:

$$f_{NCO} = \frac{M \times f_s}{2^{32}} \quad (1)$$

where M is the decimal representation of FREQ\_NCO[31:0].

The phase of the NCO can be set from 0° to 360° by both registers PHINCO\_LSB and PHINCO\_MSB over 16 bits.

The default setting is  $f_{NCO} = 96$  MHz when  $f_s = 640$  Msps and the default phase is 0°.

### 10.6.2 Low-power NCO

When using the low-power NCO, the frequency can be set by the five MSBs of register FREQNCO\_MSB.

The frequency for the low-power NCO is calculated as follows:

$$f_{NCO} = \frac{M \times f_s}{2^5} \quad (2)$$

where M is the decimal representation of FREQ\_NCO[31:27].

The phase of the low-power NCO can be set by the five MSBs of the register PHINCO\_MSB.

### 10.6.3 Minus\_3dB

During normal use, a full-scale pattern will also be full scale at the output of the DAC. Nevertheless, when the I and Q data are simultaneously close to full scale, some clipping can occur and the Minus\_3dB function can be used to reduce the gain in the modulator by 3 dB. This is to keep a full scale range at the output of the DAC without added interferers.

## 10.7 x / (sin x)

The roll-off effect of the DAC causes a selectable FIR filter to be inserted to compensate for the (sin x) / x effect. This filter introduces a DC loss of 3.4 dB. The coefficients are represented in [Table 12 “Inversion filter coefficients”](#).

**Table 12.** Inversion filter coefficients

First interpolation filter		
Lower	Upper	Value
H(1)	H(9)	2
H(2)	H(8)	-4
H(3)	H(7)	10
H(4)	H(6)	-35
H(5)	-	401

## 10.8 DAC transfer function

The full scale output current for each DAC is the sum of the two complementary current outputs:

$$I_{O(f_s)} = I_{IOUTP} + I_{IOUTN} \quad (3)$$

The output current depends on the digital input data:

$$I_{IOUTP} = I_{O(f_s)} \times \left( \frac{DATA}{16383} \right) \quad (4)$$

$$I_{IOUTN} = I_{O(f_s)} \times \left( \frac{16383 - DATA}{16383} \right) \quad (5)$$

The setting applied to CODING (register 00h[2]; see [Table 18 “Page 0 register allocation map”](#)) defines whether the DAC1408D650 operates with a binary input or a two’s complement input.

[Table 13](#) shows the output current as a function of the input data, when  $I_{O(f_s)} = 20$  mA.

**Table 13.** DAC transfer function

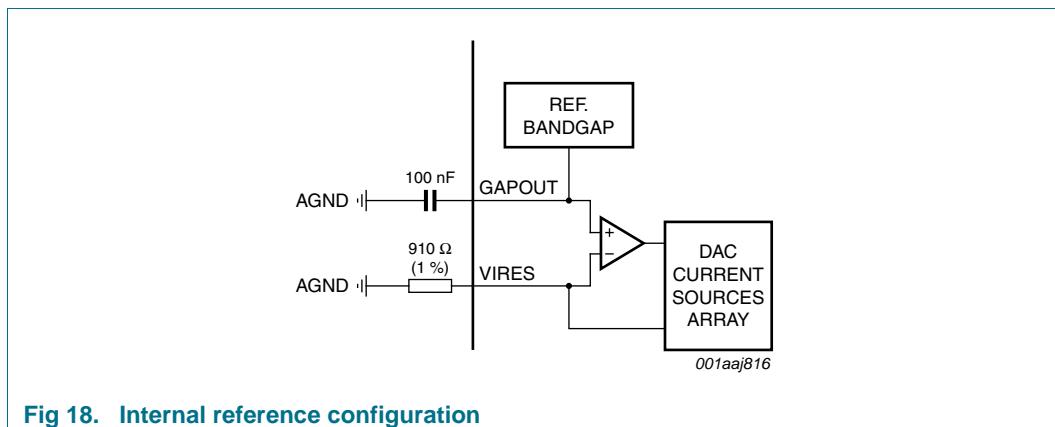

Data	I13/Q13 to I0/Q0		IOUTP	IOUTN
	Binary	Two’s complement		
0	00 0000 0000 0000	10 0000 0000 0000	0 mA	20 mA
...	...	...	...	...
2048	10 0000 0000 0000	00 0000 0000 0000	10 mA	10 mA
...	...	...	...	...
4095	11 1111 1111 1111	01 1111 1111 1111	20 mA	0 mA

## 10.9 Full scale current

### 10.9.1 Regulation

The DAC1408D650 reference circuitry integrates an internal bandgap reference voltage which delivers a 1.25 V reference to the GAPOUT pin. It is recommended to decouple pin GAPOUT using a 100 nF capacitor.

The reference current is generated via an external resistor of  $909\ \Omega$  (1 %) connected to pin VIRES. A control amplifier sets the appropriate full scale current ( $I_{O(fs)}$ ) for both DACs (see [Figure 18](#)).

**Fig 18. Internal reference configuration**

This configuration is optimum for temperature drift compensation because the bandgap reference voltage can be matched to the voltage across the feedback resistor.

#### 10.9.1.1 External regulation

The DAC current can also be set by applying an external reference voltage to the non-inverting input pin GAPOUT and disabling the internal bandgap reference voltage with GAP\_PD (register 00h[0]; see [Table 19 “COMMON register \(address 00h\) bit description](#)).

### 10.9.2 Full scale current adjustment

The default full scale current ( $I_{O(fs)}$ ) is 20 mA but further adjustments can be made by the user to both DACs independently using the serial interface from 1.6 mA to 22 mA,  $\pm 10\%$ .

The settings applied to DAC\_A\_GAIN\_COARSE[3:0] (register 0Ah; see [Table 29 “DAC\\_A\\_CFG\\_2 register \(address 0Ah\) bit description](#)) and register 0Bh; see [Table 30 “DAC\\_A\\_CFG\\_3 register \(address 0Bh\) bit description](#)) and DAC\_B\_GAIN\_COARSE[3:0] (register 0Dh; see [Table 32 “DAC\\_B\\_CFG\\_2 register \(address 0Dh\) bit description](#)) and register 0Eh; see [Table 33 “DAC\\_B\\_CFG\\_3 register \(address 0Eh\) bit description](#)) define the coarse variation of the full scale current (see [Table 14](#)).

**Table 14.**  $I_{O(fs)}$  coarse adjustment

Default settings are shown highlighted.

DAC_GAIN_COARSE[3:0]		$I_{O(fs)}$ (mA)
Decimal	Binary	
0	0000	1.6
1	0001	3.0
2	0010	4.4
3	0011	5.8
4	0100	7.2
5	0101	8.6
6	0110	10.0
7	0111	11.4
8	1000	12.8
9	1001	14.2
10	1010	15.6
11	1011	17.0
12	1100	18.5
<b>13</b>	<b>1101</b>	<b>20.0</b>
14	1110	21.0
15	1111	22.0

The settings applied to DAC\_A\_GAIN\_FINE[5:0] (register 0Ah; see [Table 29 “DAC\\_A\\_CFG\\_2 register \(address 0Ah\) bit description”](#)) and to DAC\_B\_GAIN\_FINE[5:0] (register 0Dh; see [Table 32 “DAC\\_B\\_CFG\\_2 register \(address 0Dh\) bit description”](#)) define the fine variation of the full scale current (see [Table 15](#)).

**Table 15.**  $I_{O(fs)}$  fine adjustment

Default settings are shown highlighted.

DAC_GAIN_FINE[5:0]		Delta $I_{O(fs)}$
Decimal	Two's complement	
-32	10 0000	-10 %
...	...	...
<b>0</b>	<b>00 0000</b>	<b>0</b>
...	...	...
31	01 1111	+10 %

The coding of the fine gain adjustment is two's complement.

## 10.10 Digital offset adjustment

When the DAC1408D650 analog output is DC connected to the next stage, the digital offset correction can be used to adjust the common mode level at the output of the DAC. It adds an offset at the end of the digital part, just before the DAC.

The settings applied to DAC\_A\_OFFSET[11:0] (register 09h; see [Table 28 “DAC\\_A\\_CFG\\_1 register \(address 09h\) bit description”](#) and register 0Bh; see [Table 30 “DAC\\_A\\_CFG\\_3 register \(address 0Bh\) bit description”](#)) and to “DAC\_B\_OFFSET[11:0]”

(register 0Ch; see [Table 31 “DAC\\_B\\_CFG\\_1 register \(address 0Ch\) bit description](#)” and register 0Eh; see [Table 33 “DAC\\_B\\_CFG\\_3 register \(address 0Eh\) bit description](#)”) define the range of variation of the digital offset (see [Table 16](#)).

**Table 16. Digital offset adjustment**

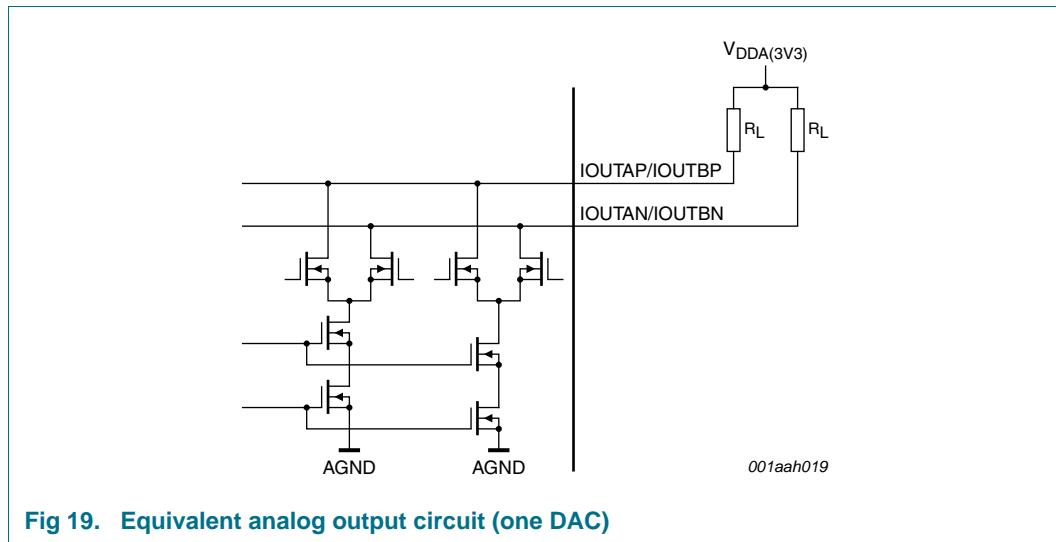

*Default settings are shown highlighted.*

DAC_OFFSET[11:0]	Offset applied	
Decimal	Two's complement	
-2048	1000 0000 0000	-4096
-2047	1000 0000 0001	-4094
...	...	...
-1	1111 1111 1111	-2
<b>0</b>	<b>0000 0000 0000</b>	<b>0</b>
+1	0000 0000 0001	+2
...	...	...
+2046	0111 1111 1110	+4092
+2047	0111 1111 1111	+4094

## 10.11 Analog output

The DAC1408D650 has two output channels each of which produces two complementary current outputs. These allow the even-order harmonics and noise to be reduced. The pins are IOUTAP/IOUTAN and IOUTBP/IOUTBN respectively and need to be connected via a load resistor  $R_L$  to the 3.3 V analog power supply ( $V_{DDA(3V3)}$ ).

For the equivalent analog output circuit of one DAC, refer to [Figure 19](#). This circuit consists of a parallel combination of NMOS current sources, and their associated switches, for each segment.

**Fig 19. Equivalent analog output circuit (one DAC)**

The cascode source configuration increases the output impedance of the source, thus improving the dynamic performance of the DAC by introducing less distortion.

The device can provide an output level of up to  $2 V_{o(p-p)}$ , depending on the application, the following stages and the targeted performances.

## 10.12 Auxiliary DACs

The DAC1408D650 integrates two auxiliary DACs that can be used to compensate for any offset between the DAC and the next stage in the transmission path.

Both auxiliary DACs have a 10-bit resolution and are current sources (referenced to ground).

$$I_{O(AUX)} = I_{AUXP} + I_{AUXN} \quad (6)$$

The output current depends on the auxiliary DAC data:

$$AUXP = I_{O(AUX)} \times \left( \frac{AUX[9:0]}{1023} \right) \quad (7)$$

$$AUXN = I_{O(AUX)} \times \left( \frac{1023 - AUX[9:0]}{1023} \right) \quad (8)$$

[Table 17](#) shows the output current as a function of the auxiliary DAC data.

**Table 17. Auxiliary DAC transfer function**

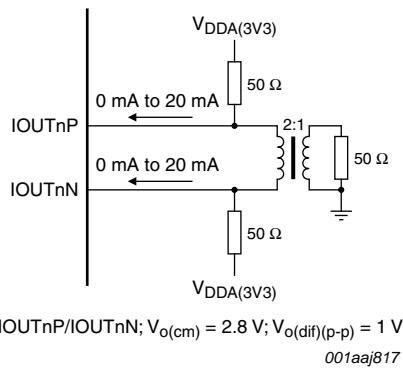

*Default settings are shown highlighted.*

Data	AUX[9:0] (binary)	I <sub>AUXP</sub>	I <sub>AUXN</sub>
0	00 0000 0000	0 mA	2.2 mA
...	...	...	...
<b>512</b>	<b>10 0000 0000</b>	<b>1.1 mA</b>	<b>1.1 mA</b>
...	...	...	...
1023	11 1111 1111	2.2 mA	0 mA

## 10.13 Output configuration

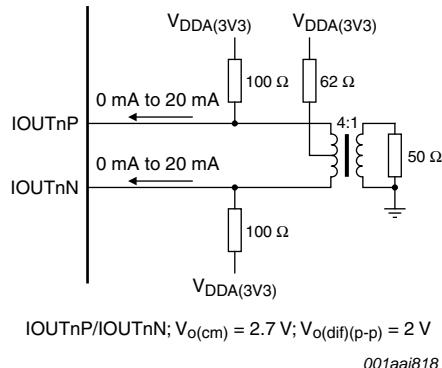

### 10.13.1 Basic output configuration

The use of a differentially-coupled transformer output provides optimum distortion performance (see [Figure 20](#)). In addition, it helps to match the impedance and provides electrical isolation.

**Fig 20.** 1 V<sub>o(p-p)</sub> differential output with transformer

The DAC1408D650 can operate up to 2 V<sub>o(p-p)</sub> differential outputs. In this configuration, it is recommended to connect the center tap of the transformer to a 62 Ω resistor connected to the 3.3 V analog power supply, in order to adjust the DC common mode to approximately 2.7 V (see [Figure 21](#)).

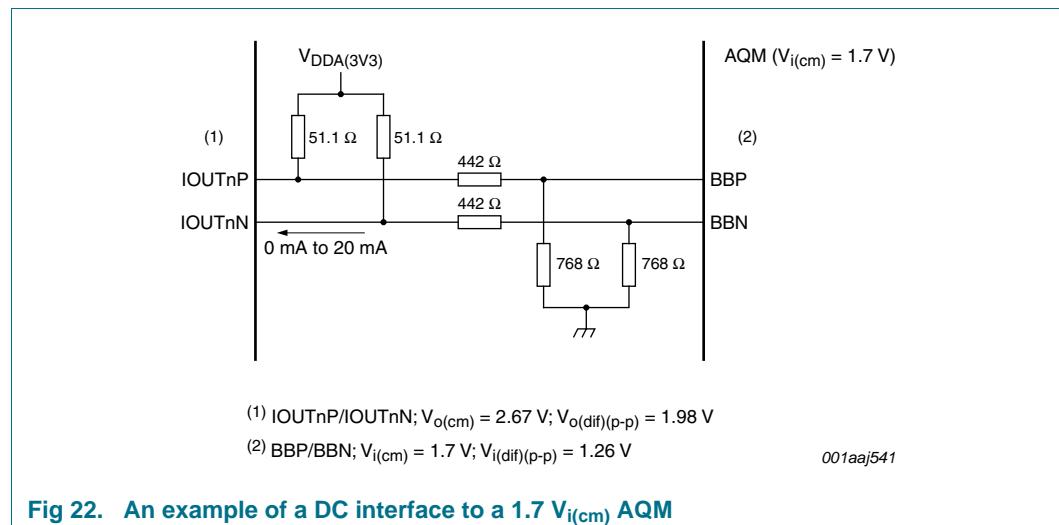

**Fig 21.** 2 V<sub>o(p-p)</sub> differential output with transformer

### 10.13.2 DC interface to an Analog Quadrature Modulator (AQM)

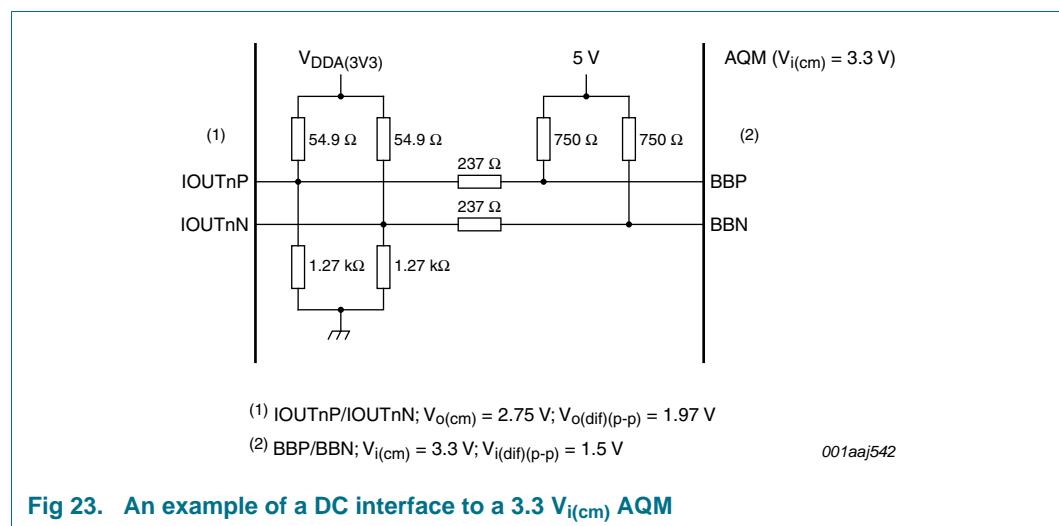

When the system operation requires to keep the DC component of the spectrum, the DAC1408D650 can use a DC interface to connect to an AQM. In this case, the offset compensation for LO cancellation can be made with the use of the digital offset control in the DAC.

[Figure 22](#) provides an example of a connection to an AQM with a 1.7 V<sub>i(cm)</sub> common mode input level.

**Fig 22. An example of a DC interface to a 1.7 V<sub>i(cm)</sub> AQM**

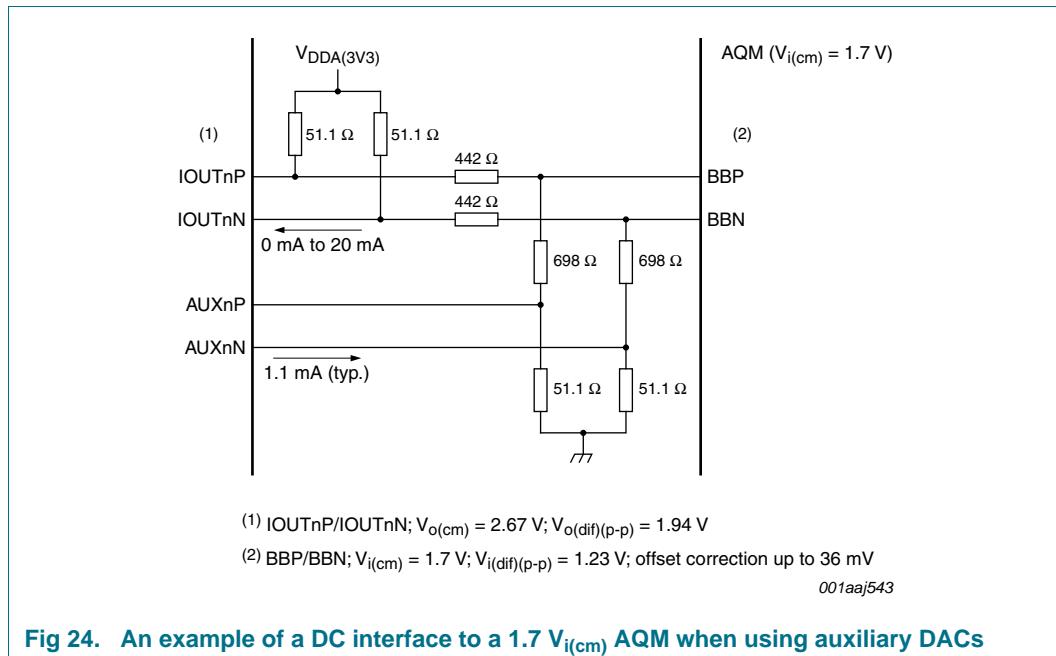

[Figure 23](#) provides an example of a connection to an AQM with a 3.3 V<sub>i(cm)</sub> common mode input level.

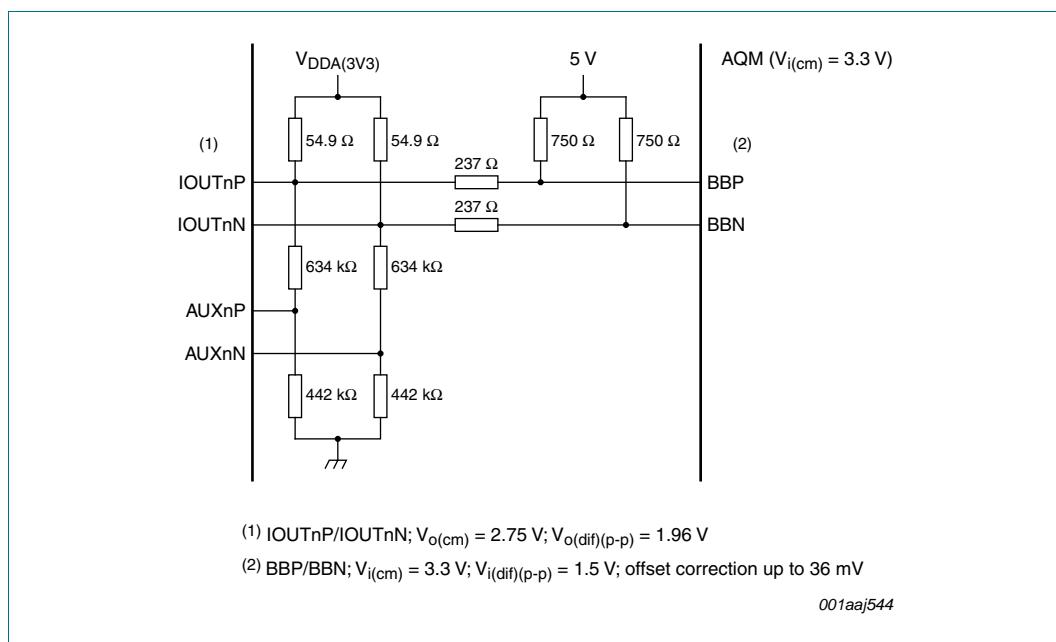

**Fig 23. An example of a DC interface to a 3.3 V<sub>i(cm)</sub> AQM**

The auxiliary DACs can be used to control the offset in a precise range or with precise steps.

[Figure 24](#) provides an example of a DC interface with the auxiliary DACs to an AQM with a 1.7 V<sub>i(cm)</sub> common mode input level.

**Fig 24.** An example of a DC interface to a 1.7  $V_{i(cm)}$  AQM when using auxiliary DACs

[Figure 25](#) provides an example of a DC interface with the auxiliary DACs to an AQM with a 3.3  $V_{i(cm)}$  common mode input level.

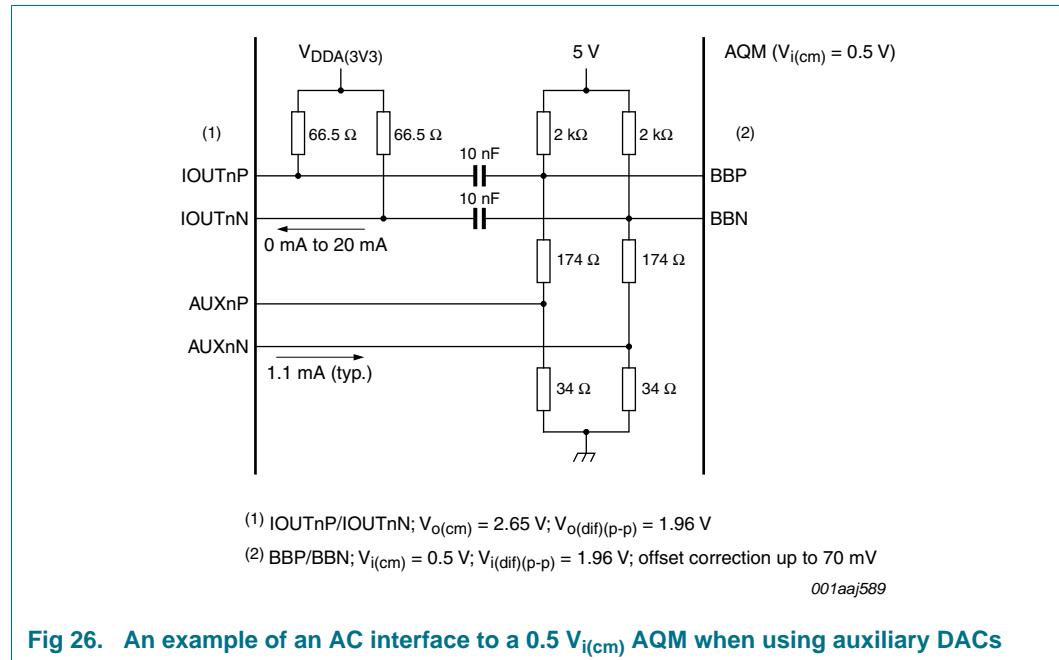

**Fig 25.** An example of a DC interface to a 3.3  $V_{i(cm)}$  AQM when using auxiliary DACs

The constraints to adjust the interface are the output compliance range of the DAC and the auxiliary DACs, the input common mode level of the AQM, and the range of offset correction.

### 10.13.3 AC interface to an Analog Quadrature Modulator (AQM)

When the AQM common mode voltage is close to ground, the DAC1408D650 must be AC-coupled and the auxiliary DACs are needed for offset correction.

[Figure 26](#) provides an example of a connection to an AQM with a 0.5 V<sub>i(cm)</sub> common mode input level when using auxiliary DACs.

#### 10.13.4 Phase correction

The Analog Quadrature Modulator which follows the DACs may have a phase imbalance which will result in undesired sideband. By adjusting the phase between the I and Q channels, the spur can be reduced.

Without compensation the I and Q have a phase difference of  $\Pi/2$  ( $90^\circ$ ). The registers Phasecorr\_cntrl0 and Phasecorr\_cntrl1 located in register page 0 allow a phase variation from  $75,7^\circ$  to  $104,3^\circ$ . The two registers define a signed value that range from  $-512$  to  $+511$ . The resulting phase compensation (in radians) is given by the equation:  
Phasecorr\_cntrl[9:0] / 2048.

### 10.14 Power and grounding

The power supplies should be decoupled with the following ground pins to optimize the decoupling:

- $V_{DDA(1V8)}$ : pin 38 with pin 37; pin 44 with pin 43; pin 11 with pin 12; pin 17 with pin 18; pin 32 with pin 31.

### 10.15 Configuration interface

#### 10.15.1 Register description

DAC1408D650 implements indirect addressing using a page access method. The page-address is located at address 0x1F and is by default 0x00, which selects page 0 as default page. For example, to access registers which configure the JESDRX, one must first activate page 4 by writing 0x04 to the page-address 0x1F.

The DAC1408D650 contains six different pages.

The device has no embedded power-on-reset feature. Driving the RESET\_N pin to set the device to its default state is mandatory.

#### 10.15.2 Detailed descriptions of registers

The register information has been provided in page form accompanied by a detailed description for each bit in the tables following the register allocation map of each page.

### 10.15.2.1 Page 0 allocation map description

**Table 18.** Page 0 register allocation map

Address	Register name	R/W	Bit definition									Default					
			b7	b6	b5	b4	b3	b2	b1	b0		Bin	Hex				
0 00h	COMMON	R/W	SPI_3W	SPI_RST	-	-	-	DF	PD_ALL	PD_GAP	10000100	84h

### 10.15.2.2 Page 0 bit definition detailed description

Please refer to [Table 18](#) for a register overview for page 0. In the following tables, all the values emphasized in bold are the default values.

**Table 19. COMMON register (address 00h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SPI_3W	R/W		serial interface bus type
			0	4 wire SPI
			1	<b>3 wire SPI</b>
6	SPI_RST	R/W		serial interface reset
			0	<b>no reset</b>
			1	performs a reset on all registers except 0x00
2	DF	R/W		data format
			0	unsigned format
			1	<b>signed (two's compliment) format</b>
1	PD_ALL	R/W		power-down
			0	<b>no action</b>
			1	all circuits (digital and analog) are switched off
0	GAP_PD	R/W		internal bandgap power-down
			0	<b>no action</b>
			1	internal bandgap references are switched off

**Table 20. TXCFG register (address 01h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	NCO_EN	R/W		NCO
			0	<b>disabled (the NCO phase is reset to 0)</b>
			1	enabled
6	NCO_LP_SEL	R/W		low-power NCO
			0	<b>NCO may use all 32 bits</b>
			1	NCO frequency and phase given by the five MSBs of the registers 06h and 08h respectively
5	INV_SINE_EN	R/W		x / (sin x) function
			0	<b>disabled</b>
			1	enabled
4 to 2	MODE[2:0]	R/W		modulation
			000	<b>dual DAC: no modulation</b>
			001	positive upper single sideband up-conversion
			010	positive lower single sideband up-conversion
			011	negative upper single sideband up-conversion
			100	negative lower single sideband up-conversion

**Table 20.** TXCFG register (address 01h) bit description ...continued  
*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
1 to 0	INT_FIR[1:0]	R/W		interpolation
			00	no interpolation
			01	<b>2<math>\times</math></b>
			10	4 $\times$
			11	8 $\times$

**Table 21.** PLLCFG register (address 02h) bit description  
*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	PLL_PD	R/W		PLL
			0	<b>switched on</b>
			1	switched off
6	-	R/W	0	undefined
5	-	R/W	0	Must be written with '0'
4 to 3	PLL_DIV[1:0]	R/W		PLL divider factor
			00	<b>2</b>
			01	4
			10	8
2 to 1	PLL_PHASE[1:0]	R/W		PLL phase shift of f <sub>s</sub>
			00	<b>0 °</b>
			01	120 °
			10	240 °
			11	undefined
0	PLL_POL	R/W		clock edge of DAC (f <sub>s</sub> )
			0	<b>normal</b>
			1	inverted

**Table 22.** FREQNCO LSB register (address 03h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[7:0]	R/W	66h	lower 8 bits for the NCO frequency setting

**Table 23.** FREQNCO LISB register (address 04h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[15:8]	R/W	66h	lower intermediate 8 bits for the NCO frequency setting

**Table 24.** FREQNCO UISB register (address 05h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[23:16]	R/W	66h	upper intermediate 8 bits for the NCO frequency setting

**Table 25.** FREQNCO\_MSB register (address 06h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[31:24]	R/W	26h	most significant 8 bits for the NCO frequency setting

**Table 26.** PHINCO\_LSB register (address 07h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	PH_NCO[7:0]	R/W	00h	lower 8 bits for the NCO phase setting

**Table 27.** PHINCO\_MSB register (address 08h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	PH_NCO[15:8]	R/W	00h	most significant 8 bits for the NCO phase setting

**Table 28.** DAC\_A\_CFG\_1 register (address 09h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	DAC_A_PD	R/W		DAC A power
			0	on
			1	off
6	DAC_A_SLEEP	R/W		DAC A Sleep mode
			0	disabled
			1	enabled
5 to 0	DAC_A_OFFSET[5:0]	R/W	00h	lower 6 bits for the DAC A offset

**Table 29.** DAC\_A\_CFG\_2 register (address 0Ah) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_A_GAIN_COARSE[1:0]	R/W	1h	least significant 2 bits for the DAC A gain setting for coarse adjustment
5 to 0	DAC_A_GAIN_FINE[5:0]	R/W	00h	lower 6 bits for the DAC A gain setting for fine adjustment

**Table 30.** DAC\_A\_CFG\_3 register (address 0Bh) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_A_GAIN_COARSE[3:2]	R/W	3h	most significant 2 bits for the DAC A gain setting for coarse adjustment
5 to 0	DAC_A_OFFSET[11:6]	R/W	00h	most significant 6 bits for the DAC A offset

**Table 31.** DAC\_B\_CFG\_1 register (address 0Ch) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	DAC_B_PD	R/W		DAC B power
			0	on
			1	off
6	DAC_B_SLEEP	R/W		DAC B Sleep mode
			0	disabled
			1	enabled
5 to 0	DAC_B_OFFSET[5:0]	R/W	00h	lower 6 bits for the DAC B offset

**Table 32.** DAC\_B\_CFG\_2 register (address 0Dh) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_B_GAIN_COARSE[1:0]	R/W	1h	less significant 2 bits for the DAC B gain setting for coarse adjustment
5 to 0	DAC_B_GAIN_FINE[5:0]	R/W	00h	the 6 bits for the DAC B gain setting for fine adjustment

**Table 33.** DAC\_B\_CFG\_3 register (address 0Eh) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_B_GAIN_COARSE[3:2]	R/W	3h	most significant 2 bits for the DAC B gain setting for coarse adjustment
5 to 0	DAC_B_OFFSET[11:6]	R/W	00h	most significant 6 bits for the DAC B offset

**Table 34.** DAC\_CFG register (address 0Fh) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
1	MINUS_3DB	R/W		NCO gain
			0	unity
			1	-3 dB
0	NOISE_SHAPER	R/W		noise shaper
			0	disabled
			1	enabled

**Table 35.** DAC\_CURRENT\_0 register (address 11h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
3 to 1	DAC_DIG_BIAS[2:0]	R/W	3h	bias current control (see <a href="#">Table 47</a> )

**Table 36.** DAC\_CURRENT\_1 register (address 12h) bit description*Default settings are shown highlighted.*

#### 10.15.2.4 Page 1 bit definition detailed description

Please refer to [Table 48](#) for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 49. MDS\_MAIN register (address 00h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 6	MDS_EQCHECK[1:0]	R/W		lock mode
			<b>00</b>	<b>lock when (early = 1 and late = 1)</b>
			01	lock when (early = 1 and late = 1 and equal = 1)
			10	lock when equal = 1
			11	force_lock (equal-check = 1)
5	MDS_RUN	R/W		evaluation restart
			<b>0</b>	<b>no action</b>
			1	transition from 0 to 1 restarts evaluation_counter
4	MDS_NCO	R/W		NCO synchronization
			<b>0</b>	<b>no action</b>
			1	NCO synchronization enabled
3	MDS_SEL_LN23	R/W		synchronization reference
			<b>0</b>	<b>use lane 1 enable as reference for synchronization</b>
			1	use lane 2/lane 3 enable as reference for synchronization
2	MDS_32T_ENA	R/W		maximum delay
			0	maximum coarsedelay is 16T_dclk
			1	<b>maximum coarsedelay is 32T_dclk</b>
1	MDS_MASTER	R/W		MDS mode
			<b>0</b>	<b>slave mode</b>
			1	master mode
0	MDS_ENA	R/W		MDS function
			<b>0</b>	<b>disable MDS function</b>
			1	enable MDS function

**Table 50. MDS\_WIN\_PERIOD\_A register (address 01h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	MDS_WIN_PERIOD_A[7:0]	R/W	80h	determines mds_window low-time

**Table 51. MDS\_WIN\_PERIOD\_B register (address 02h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	MDS_WIN_PERIOD_B[7:0]	R/W	40h	determines mds_window high-time

**Table 52.** MDS\_MISCCNTRL0 register (address 03h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
4	MDS_EVAL_ENA	R/W		mds_evaluation
			0	disabled
			1	<b>enabled</b>
3	MDS_PRERUN_ENA	R/W		Automatic MDS start-up
			0	<b>no mds_win/mds_ref generation in advance</b>
			1	mds_win/mds_ref run-in before mds_evaluation
2 to 0	MDS_PULSEWIDTH[2:0]	R/W		width of MDS (in output clk-periods)
			000	<b>1 T</b>
			001	2 T
			010 to 111	(mds_pulsewidth - 1) $\times$ 4T

**Table 53.** MDS\_MAN\_ADJUSTDLY register (address 04h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	MDS_MAN	R/W		adjustment delays mode
			0	<b>auto-control adjustment delays</b>
			1	manual control adjustment delays
6 to 0	MDS_MAN_ADJUSTDLY[6:0]	R/W		adjustment delay value
			40h	if MDS_MAN = 0 then initial value adjustment delay
			-	if MDS_MAN = 1 then controls adjustment delay

**Table 54.** MDS\_AUTO\_CYCLES register (address 05h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	MDS_AUTO_CYCLES[7:0]	R/W	80h	number of evaluation cycles applied for MDS

**Table 55.** MDS\_MISCCNTRL1 register (address 06h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	MDS_SR_CKEN	R/W		lock mode
			0	<b>free-running mds_cken</b>
			1	mds_cken forced low
6	MDS_SR_LOCKOUT	R/W		lockout detector soft reset
			0	<b>mds_lockout in use</b>
			1	mds_lockout forced low
5	MDS_SR_LOCK	R/W		lock detector soft reset
			0	<b>mds_lock in use</b>
			1	mds_lock forced low

**Table 55. MDS\_MISCCNTRL1 register (address 06h) bit description ...continued**  
*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4	MDS_RELOCK	R/W		relock mode
			0	<b>no action</b>
			1	relock when lockout occurs
3 to 0	MDS_LOCK_DELAY[3:0]	R/W	Fh	number of succeeding 'equal'-detections until lock

**Table 56. MDS\_ADJDELAY register (address 08h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
6 to 0	MDS_ADJDELAY[6:0]	R	-	actual value adjustment delay

**Table 57. MDS\_STATUS0 register (address 09h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	EARLY	R		early signal (sampled) from early-late detector
			0	false
			1	true
6	LATE	R		late signal (sampled) from early-late detector
			0	false
			1	true
5	EQUAL	R		equal signal (sampled) from early-late detector
			0	false
			1	true
4	MDS_LOCK	R		result equal check
			0	false
			1	true
3	EARLY_ERROR	R		adjustment delay maximum value stops the search
			0	false
			1	true
2	LATE_ERROR	R		adjustment delay minimum value stops the search
			0	false
			1	true
1	EQUAL_FOUND	R		eval_logic has detected equal condition
			0	false
			1	true
0	MDS_ACTIVE	R		eval_logic active
			0	false
			1	true

**Table 58.** MDS\_STATUS1 register (address 0Ah) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
3	JD_ODD	R		MDS start mode
			0	mds start aligned to cdi-even sample
			1	mds start aligned to cdi-odd sample (only for ^2)
2	MDS_PRERUN	R		MDS prerun phase active flag
			0	false
			1	true
1	MDS_LOCKOUT	R		MDS lockout detected flag
			0	false
			1	true
0	MDS_LOCK	R		MDS lock flag
			0	false
			1	true

**Table 59.** PAGE\_ADDRESS register (address 1Fh) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
2 to 0	PAGE[2:0]	R/W	0h	page address

### 10.15.2.5 Page 2 allocation map description

**Table 60.** Page 2 register allocation map

Address	Register name	R/W	Bit definition								Default							
			b7	b6	b5	b4	b3	b2	b1	b0	Bin	Hex

### 10.15.2.6 Page 2 bit definition detailed description

Please refer to [Table 60](#) for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 61. MAINCONTROL register (address 00h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
5	FULL_RE_INIT	R/W		initialization
			1	full re-initialization
			0	<b>quick reinitialization</b>
4	SYNC_INIT_LEVEL	R/W		synchronization
			0	<b>synchronization starts with '0'</b>
3	-	R/W		synchronization starts with '1'
			1	must be written with '0'
2	-	R/W		must be written with '0'
			1	reset_dclk
1	FORCE_RESET_DCLK	R/W		release reset_dclk
			1	<b>force reset_dclk</b>
0	FORCE_RESET_FCLK	R/W		reset_fclk
			0	release reset_fclk
			1	<b>force reset_fclk</b>

**Table 62. JCLK\_CNTRL register (address 03h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SR_CDI	R/W		cdi reset
			1	soft reset cdi
			0	<b>no action</b>
5 to 4	CDI_MODE[1:0]	R/W		cdi mode
			00	<b>cdi_mode 0 (^2 modes)</b>
			01	cdi_mode 1 (^4 modes)
			10	cdi_mode 2 (^8 modes)
			11	reserved
2	FCLK_POL	R/W		fclk polarity
			0	<b>no action</b>
			1	invert polarity
1 to 0	FCLK_SEL[1:0]	R/W		fclk clock source
			00	<b>dclk × 2</b>
			01	dclk
			10	dclk_div2; running
			11	dclk_div2; reset dclk_div2 divider

**Table 63.** RST\_EXT\_FCLK register (address 04h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	RST_EXT_FCLK[7:0]	R/W	3Fh	specifies extension time reset_fclk in f <sub>clk</sub> periods

**Table 64.** RST\_EXT\_DCLK register (address 05h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	RST_EXT_DCLK[7:0]	R/W	20h	specifies extension time reset_dclk (in dclk-periods)

**Table 65.** DCSMU\_PREDIVCNT register (address 06h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	DCSMU_PREDIVCNT[7:0]	R/W	1Eh	value used by dcsmu predivider (at f <sub>clk</sub> )

**Table 66.** PLL\_CHARGETIME register (address 07h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	PLL_CHARGE_TIME[7:0]	R/W	32h	PLL charge time (at f <sub>clk</sub> /predivcnt; start-up)

**Table 67.** PLL\_RUN\_IN\_TIME register (address 08h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	PLL_RUNIN_TIME[7:0]	R/W	32h	PLL run in time (at f <sub>clk</sub> /predivcnt; sel_pd)

**Table 68.** CA\_RUN\_IN\_TIME register (address 09h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	CA_RUNIN_TIME[7:0]	R/W	04h	clock alignment run in time (at f <sub>clk</sub> /predivcnt)

**Table 69.** SET\_VCM\_VOLTAGE register (address 16h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
3 to 0	SET_VCM[3:0]	R/W	02h	set V <sub>cm</sub> voltage level (see <a href="#">Table 76</a> )

**Table 70.** SET\_SYNC register (address 17h) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
6 to 4	SET_SYNC_VCOM[2:0]	R/W	4h	set synchronization transmitter common-mode level (see <a href="#">Table 77</a> )
2 to 0	SET_SYNC_LEVEL[2:0]	R/W	3h	set synchronization transmitter output level swing (see <a href="#">Table 78</a> )

**Table 71.** TYPE\_ID register (address 1Bh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	DAC	R		part type
			0	adc
			1	<b>dac</b>
6 to 5	FRONTEND [1:0]	R		input format
			00	cmos
			01	lvds
			10	<b>jesd204a</b>
			11	reserved
4	DUAL	R		converter structure
			1	<b>dual</b>
			0	single
3 to 2	DSP	R		digital processing
			00	none
			01	upfir
			10	ifssbm
			11	<b>upfir + ifssbm</b>
1 to 0	BIT_RES[1:0]	R		resolution
			00	16 bits
			01	<b>14 bits</b>
			10	12 bits
			11	10 bits

**Table 72.** DAC\_VERSION register (address 1Ch) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	DAC_VERSION_ID[7:0]	R	01h	dual dac core version

**Table 73.** DIG\_VERSION register (address 1Dh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	DIG_VERSION_ID[7:0]	R	02h	digital version

**Table 74.** JRX\_ANA\_VERSION register (address 1Eh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 0	JRX_ANA_VERSION_ID[7:0]	R	02h	analog deserializer version

**Table 75.** PAGE\_ADDRESS register (address 1Fh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
2 to 0	PAGE[2:0]	R/W	0h	page address

**Table 76.** Lane common-mode voltage adjustment**Register 16h: SET\_VCM\_VOLTAGE**

Dec	SET_VCM_VOLTAGE	V <sub>com</sub> (V)
15	1111	1.40
14	1110	1.36
13	1101	1.31
12	1100	1.26
11	1011	1.21
10	1010	1.16

### 10.15.2.8 Page 4 bit definition detailed description

Please refer to [Table 79](#) for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 80. SR\_DLP\_0 register (address 00h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SR_SWA_LN3	R/W	0	softreset sync_word_alignment lane 3
6	SR_SWA_LN2	R/W	0	softreset sync_word_alignment lane 2
5	SR_SWA_LN1	R/W	0	softreset sync_word_alignment lane 1
4	SR_SWA_LN0	R/W	0	softreset sync_word_alignment lane 0
3	SR_CA_LN3	R/W	0	softreset clock_alignment lane 3
2	SR_CA_LN2	R/W	0	softreset clock_alignment lane 2
1	SR_CA_LN1	R/W	0	softreset clock_alignment lane 1
0	SR_CA_LN0	R/W	0	softreset clock_alignment lane 0

**Table 81. SR\_DLP\_1 register (address 01h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SR_CNTRL_LN3	R/W	0	soft reset controller lane 3
6	SR_CNTRL_LN2	R/W	0	soft reset controller lane 2
5	SR_CNTRL_LN1	R/W	0	soft reset controller lane 1
4	SR_CNTRL_LN0	R/W	0	soft reset controller lane 0
3	SR_DEC_LN3	R/W	0	soft reset decoder_10b8b lane 3
2	SR_DEC_LN2	R/W	0	soft reset decoder_10b8b lane 2
1	SR_DEC_LN1	R/W	0	soft reset decoder_10b8b lane 1
0	SR_DEC_LN0	R/W	0	soft reset decoder_10b8b lane 0

**Table 82. FORCE\_LOCK register (address 02h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	FORCE_LOCK_LN3	R/W		lane 3 lock mode
			0	<b>automatic lock sync_word_alignment lane 3</b>
			1	manual lock sync_word_alignment lane 3
6	FORCE_LOCK_LN2	R/W		lane 2 lock mode
			0	<b>automatic lock sync_word_alignment lane 2</b>
			1	manual lock sync_word_alignment lane 2
5	FORCE_LOCK_LN1	R/W		lane 1 lock mode
			0	<b>automatic lock sync_word_alignment lane 1</b>
			1	manual lock sync_word_alignment lane 1
4	FORCE_LOCK_LN0	R/W		lane 0 lock mode
			0	<b>automatic lock sync_word_alignment lane 0</b>
			1	manual lock sync_word_alignment lane 0

**Table 82. FORCE\_LOCK register (address 02h) bit description ...continued**  
*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
0	SR_ILA	R/W		soft reset interlane alignment
			0	<b>no action</b>
			1	reset

**Table 83. MAN\_LOCK\_LN\_1\_0 register (address 03h) bit description**  
*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 4	MAN_LOCK_LN1[3:0]	R/W	0h	manual lock setting synchronization word alignment lane 1
3 to 0	MAN_LOCK_LN0[3:0]	R/W	0h	manual lock setting synchronization word alignment lane 0

**Table 84. MAN\_LOCK\_2\_0 register (address 04h) bit description**  
*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 4	MAN_LOCK_LN3[3:0]	R/W	0h	manual lock setting synchronization word alignment lane 3
3 to 0	MAN_LOCK_LN2[3:0]	R/W	0h	manual lock setting synchronization word alignment lane 2

**Table 85. CA\_CNTRL register (address 05h) bit description**

Bit	Symbol	Access	Value	Description
7	WORD_SWAP_LN3	R/W		lane 3 bit swapping
			0	<b>dout_ca_ln3[7:0] = din_ca_ln3[7:0]</b>
			1	dout_ca_ln3[7:0] = din_ca_ln3[0:7]
6	WORD_SWAP_LN2	R/W		lane 2 bit swapping
			0	<b>dout_ca_ln2[7:0] = din_ca_ln2[7:0]</b>
			1	dout_ca_ln2[7:0] = din_ca_ln2[0:7]
5	WORD_SWAP_LN1	R/W		lane 1 bit swapping
			0	<b>dout_ca_ln1[7:0] = din_ca_ln1[7:0]</b>
			1	dout_ca_ln1[7:0] = din_ca_ln1[0:7]
4	WORD_SWAP_LN0	R/W		lane 0 bit swapping
			0	<b>dout_ca_ln0[7:0] = din_ca_ln0[7:0]</b>
			1	dout_ca_ln0[7:0] = din_ca_ln0[0:7]
3	SELECT_RF_F10_LN3	R/W		lane 3 sampling mode
			0	<b>din_ca_ln3 sampled at falling edge f10_ln3</b>
2	SELECT_RF_F10_LN2	R/W		lane 2 sampling mode
			0	<b>din_ca_ln2 sampled at falling edge f10_ln2</b>
			1	din_ca_ln2 sampled at rising edge f10_ln2

**Table 85.** CA\_CNTRL register (address 05h) bit description ...continued

Bit	Symbol	Access	Value	Description
1	SELECT_RF_F10_LN1	R/W		lane 1 sampling mode
			0	din_ca_ln1 sampled at falling edge f10_ln1
			1	din_ca_ln1 sampled at rising edge f10_ln1
0	SELECT_RF_F10_LN0	R/W		lane 0 sampling mode
			0	din_ca_ln0 sampled at falling edge f10_ln0

0	FORCE_SRC_LN0	R/W		lane 0 scrambling mode
			0	scrambling lane 0 depends on lock_ln0 and en_scr
			1	scrambling lane 0 depends on man_scr_ln0

**Table 87.** ILA\_CNTRL register (address 07h) bit description

Bit	Symbol	Access	Value	Description
7	SEL_421_211	R/W		inter-lane alignment mode
			0	inter-lane alignment based on lane 3 : lane 2 and/or lane 1 : lane 0
			1	<b>inter-lane alignment based on In3:In0</b>
6 to 5	SEL_ILA[1:0]	R/W		inter-lane alignment trigger mode
			00	<b>inter-lane alignment is done after receiving 1 /A/-symbol</b>
			01	inter-lane alignment is done after receiving 2 /A/-symbols
			10	inter-lane alignment is done after receiving 3 /A/-symbols
			11	inter-lane alignment is done after receiving 4 /A/-symbols
4 to 2	SEL_LOCK[2:0]	R/W		inter-lane alignment start mode
			000	<b>inter-lane alignment may start only if all (4 or 2) lanes are locked</b>
			001	inter-lane alignment may start if one of the (4 or 2) lanes are locked
			010	inter-lane alignment may start if lane 0 is locked
			011	inter-lane alignment may start if lane 1 is locked
			100	inter-lane alignment may start if lane 2 is locked
			101	inter-lane alignment may start if lane 3 is locked
1	SUP_LANE_SYN	R/W		inter-lane alignment enable
			0	inter-lane alignment synchronization disabled
			1	<b>inter-lane alignment synchronization enabled</b>
0	EN_SCR	R/W		data descrambling
			0	data descrambling disabled
			1	<b>enabled</b>

**Table 88.** FORCE\_ALIGN register (address 08h) bit description

Bit	Symbol	Access	Value	Description
1	DYN_ALIGN_ENA	R/W		dynamic re-alignment mode
			0	<b>no dynamic re-alignment</b>
			1	dynamic re-alignment (and monitoring) enabled
0	FORCE_ALIGN	R/W		lane alignment mode
			0	<b>automatic lane alignment based on /A/-symbols</b>
			1	manual lane alignment based on man_align_lnx

**Table 89.** MAN\_ALIGN\_LN\_0\_1 register (address 09h) bit description

Bit	Symbol	Access	Value	Description
7 to 4	MAN_ALIGN_LN1[3:0]	R/W	00h	indicates alignment data-delay for lane 1 [1..15]
3 to 0	MAN_ALIGN_LN0[3:0]	R/W	00h	indicates alignment data-delay for lane 0 [1..15]

**Table 90.** MAN\_ALIGN\_LN\_2\_3 register (address 0Ah) bit description

Bit	Symbol	Access	Value	Description
7 to 4	MAN_ALIGN_LN3[3:0]	R/W	00h	indicates alignment data-delay for lane 3 [1..15]
3 to 0	MAN_ALIGN_LN2[3:0]	R/W	00h	indicates alignment data-delay for lane 2 [1..15]

**Table 91.** FA\_ERR\_HANDLING register (address 0Bh) bit description*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 6	SEL_KOUT_UNEXP_LN23[1:0]	R/W		lane 2/lane 3 unexpected /K/ error handling
			00	<b>error_handling i.c.o. unexpected /K/ in lane 2 or lane 3</b>
			01	error_handling i.c.o. unexpected /K/ in lane 2 and lane 3
			10	error_handling i.c.o. unexpected /K/ in lane 2
			11	error_handling i.c.o. unexpected /K/ in lane 3
5 to 4	SEL_KOUT_UNEXP_LN10[1:0]	R/W		lane 0/lane 1 unexpected /K/ error handling
			00	<b>error_handling i.c.o. unexpected /K/ in lane 0 or lane 1</b>
			01	error_handling i.c.o. unexpected /K/ in lane 0 and lane 1
			10	error_handling i.c.o. unexpected /K/ in lane 0
			11	error_handling i.c.o. unexpected /K/ in lane 1
3 to 2	SEL_NIT_ERR_LN23[1:0]	R/W		lane 2/lane 3 nit-error handling
			00	<b>error_handling i.c.o. nit-errors in lane 2 or lane 3</b>
			01	error_handling i.c.o. nit-errors lane 2 and lane 3
			10	error_handling i.c.o. nit-errors in lane 2
			11	error_handling i.c.o. nit-errors in lane 3
1 to 0	SEL_NIT_ERR_LN10[1:0]	R/W		lane 0/lane 1 not-error handling
			00	<b>error_handling i.c.o. nit-errors in lane 0 or lane 1</b>
			01	error_handling i.c.o. nit-errors lane 0 and lane 1
			10	error_handling i.c.o. nit-errors in lane 0
			11	error_handling i.c.o. nit-errors in lane 1

**Table 92.** SYNCOUT\_MODE register (address 0Ch) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 5	SEL_RE_INIT[2:0]	R/W		reinitialization mode
			<b>000</b>	<b>i_re_init when 1 of the lane_rst's is active</b>
			001	i_re_init when rst_ln0 or rst_ln1 is active
			010	i_re_init when rst_ln2 or rst_ln3 is active
			011	i_re_init when rst_ln0 is active
			100	i_re_init when rst_ln1 is active
			101	i_re_init when rst_ln2 is active
			110	i_re_init when rst_ln3 is active
			111	i_re_init remains '0'
4	SYNC_POL	R/W		synchronization polarity
			<b>0</b>	<b>sync_out is active when low</b>
			1	sync_out is active when high
3 to 0	SEL_SYNC[3:0]	R/W		synchronization mode
			<b>0000</b>	<b>sync when one of the four lane_syncs is active</b>
			0001	sync when all four lane_syncs are active
			0010	sync when sync_ln0 or sync_ln1 is active
			0011	sync when both sync_ln0 and sync_ln1 are active
			0100	sync when sync_ln2 or sync_ln3 is active
			0101	sync when both sync_ln2 and sync_ln3 are active
			0110	sync when sync_ln0 is active
			0111	sync when sync_ln1 is active
			1000	sync when sync_ln2 is active
			1001	sync when sync_ln3 is active
			1010	sync remains fixed '1'
			other	sync remains fixed '0'

**Table 93.** LANE\_POLARITY register (address 0Dh) bit description

Bit	Symbol	Access	Value	Description
3	POL_LN3	R/W		lane 3 data polarity
			<b>0</b>	<b>no action</b>
			1	invert all databits of dout_ca_ln3[7:0]
2	POL_LN2	R/W		lane 2 data polarity
			<b>0</b>	<b>no action</b>
			1	invert all databits of dout_ca_ln2[7:0]
1	POL_LN1	R/W		lane 1 data polarity
			<b>0</b>	<b>no action</b>
			1	invert all databits of dout_ca_ln1[7:0]
0	POL_LN0	R/W		lane 0 data polarity
			<b>0</b>	<b>no action</b>
			1	invert all databits of dout_ca_ln0[7:0]

**Table 94.** LANE\_SELECT register (address 0Eh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 6	LANE_SEL_LN3[1:0]	R/W		lane 3 data mapping

### 10.15.2.10 Page 5 bit definition detailed description

Please refer to [Table 109](#) for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 110. ILA\_MON\_1\_0 register (address 00h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 4	ILA_MON_LN1[3:0]	R	-	ila_buf_ln1 pointer
3 to 0	ILA_MON_LN0[3:0]	R	-	ila_buf_ln0 pointer

**Table 111. ILA\_MON\_3\_2 register (address 01h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 4	ILA_MON_LN3[3:0]	R	-	ila_buf_ln3 pointer
3 to 0	ILA_MON_LN2[3:0]	R	-	ila_buf_ln2 pointer

**Table 112. ILA\_BUF\_ERR register (address 02h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
3	ILA_BUF_ERR_LN3	R		lane 3 ila buffer error
			0	ila_buf_ln3 pointer is in range
			1	ila_buf_ln3 pointer is out of range
2	ILA_BUF_ERR_LN2	R		lane 2 ila buffer error
			0	ila_buf_ln2 pointer is in range
			1	ila_buf_ln2 pointer is out of range
1	ILA_BUF_ERR_LN1	R		lane 1 ila buffer error
			0	ila_buf_ln1 pointer is in range
			1	ila_buf_ln1 pointer is out of range
0	ILA_BUF_ERR_LN0	R		lane 0 ila buffer error
			0	ila_buf_ln0 pointer is in range
			1	ila_buf_ln0 pointer is out of range

**Table 113. CA\_MON register (address 03h) bit description**

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 6	CA_MON_LN3[1:0]	R	-	clock alignment phase monitor lane 3
5 to 4	CA_MON_LN2[1:0]	R	-	clock alignment phase monitor lane 2
3 to 2	CA_MON_LN1[1:0]	R	-	clock alignment phase monitor lane 1
1 to 0	CA_MON_LN0[1:0]	R	-	clock alignment phase monitor lane 0

**Table 114.** DEC\_FLAGS register (address 04h) bit description

Bit	Symbol	Access	Value	Description
7	DEC_NIT_ERR_LN3	R	-	not-in-table-errorflag lane 3
6	DEC_NIT_ERR_LN2	R	-	not-in-table-errorflag lane 2
5	DEC_NIT_ERR_LN1	R	-	not-in-table-errorflag lane 1
4	DEC_NIT_ERR_LN0	R	-	not-in-table-errorflag lane 0
3	DEC_DISP_ERR_LN3	R	-	disparity-errorflag lane 3
2	DEC_DISP_ERR_LN2	R	-	disparity-errorflag lane 2
1	DEC_DISP_ERR_LN1	R	-	disparity-errorflag lane 1
0	DEC_DISP_ERR_LN0	R	-	disparity-errorflag lane 0

**Table 115.** KOUT\_FLAG register (address 05h) bit description

Bit	Symbol	Access	Value	Description

### 10.15.2.12 Page 6 bit definition detailed description

Please refer to [Table 143](#) for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 144. LN0\_CFG\_0 register (address 00h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN0_DID[7:0]	R	-	lane 0 device ID

**Table 145. LN0\_CFG\_1 register (address 01h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
3 to 0	LN0_BID[3:0]	R	-	lane 0 bank ID

**Table 146. LN0\_CFG\_2 register (address 02h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN0_LID[4:0]	R	-	lane 0 lane ID

**Table 147. LN0\_CFG\_3 register (address 03h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	LN0_SCR	R	-	scrambling on
4 to 0	LN0_L[4:0]	R	-	number of lanes

**Table 148. LN0\_CFG\_4 register (address 04h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN0_F[7:0]	R	-	number of octets per frame

**Table 149. LN0\_CFG\_5 register (address 05h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN0_K[4:0]	R	-	number of frames per multi-frame

**Table 150. LN0\_CFG\_6 register (address 06h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN0_M[7:0]	R	-	number of converter per device

**Table 151. LN0\_CFG\_7 register (address 07h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 6	LN0_CS[1:0]	R	-	number of control bits
4 to 0	LN0_N[4:0]	R	-	converter resolution

**Table 152. LN0\_CFG\_8 register (address 08h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN0_N'[4:0]	R	-	number of bits per sample

**Table 153. LN0\_CFG\_9 register (address 09h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN0_S[4:0]	R	-	number of samples per converter per frame cycle

**Table 154. LN0\_CFG\_10 register (address 0Ah) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	LN0_HD	R	-	high density
4 to 0	LN0_CF[4:0]	R	-	number of control words per frame cycle

**Table 155. LN0\_CFG\_11 register (address 0Bh) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN0_RES1[7:0]	R	-	lane 0 reserved field

**Table 156. LN0\_CFG\_12 register (address 0Ch) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN0_RES2[7:0]	R	-	lane 0 reserved field

**Table 157. LN0\_CFG\_13 register (address 0Dh) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN0_FCHK[7:0]	R	-	lane 0 checksum

**Table 158. LN1\_CFG\_0 register (address 10h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN1_DID[7:0]	R	-	lane1 device ID

**Table 159. LN1\_CFG\_1 register (address 11h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
3 to 0	LN1_BID[3:0]	R	-	lane 1 bank ID

**Table 160. LN1\_CFG\_2 register (address 12h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN1_LID[4:0]	R	-	lane 1 lane ID

**Table 161. LN1\_CFG\_3 register (address 13h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	LN1_SCR	R	-	scrambling on
4 to 0	LN1_L[4:0]	R	-	number of lanes

**Table 162. LN1\_CFG\_4 register (address 14h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN1_F[7:0]	R	-	number of octets per frame

**Table 163. LN1\_CFG\_5 register (address 15h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN1_K[4:0]	R	-	number of frames per multiframe

**Table 164. LN1\_CFG\_6 register (address 16h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN1_M[7:0]	R	-	number of converter per device

**Table 165. LN1\_CFG\_7 register (address 17h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 6	LN1_CS[1:0]	R	-	number of control bits
4 to 0	LN1_N[4:0]	R	-	converter resolution

**10.15.2.14 Page 7 bit definition detailed description**

Please refer to [Table 173](#) for a register overview and their default values. In the following tables, all the values emphasized in bold are the default values.

**Table 174. LN2\_CFG\_0 register (address 00h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN2_DID[7:0]	R	-	lane2 device ID

**Table 175. LN2\_CFG\_1 register (address 01h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
3 to 0	LN2_BID[3:0]	R	-	lane 2 bank ID

**Table 176. LN2\_CFG\_2 register (address 02h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN2_LID[4:0]	R	-	lane 2 lane ID

**Table 177. LN2\_CFG\_3 register (address 03h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	LN2_SCR	R	-	scrambling on
4 to 0	LN2_L[4:0]	R	-	number of lanes

**Table 178. LN2\_CFG\_4 register (address 04h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN2_F[7:0]	R	-	number of octets per frame

**Table 179. LN2\_CFG\_5 register (address 05h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN2_K[4:0]	R	-	number of frames per multiframe

**Table 180. LN2\_CFG\_6 register (address 06h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN2_M[7:0]	R	-	number of converter per device

**Table 181. LN2\_CFG\_7 register (address 07h) bit description**

*Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 6	LN2_CS[1:0]	R	-	number of control bits
4 to 0	LN2_N[4:0]	R	-	converter resolution

**Table 182. LN2\_CFG\_8 register (address 08h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN2_N'[4:0]	R	-	number of bits per sample

**Table 183. LN2\_CFG\_9 register (address 09h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
4 to 0	LN2_S[4:0]	R	-	number of samples per converter per frame cycle

**Table 184. LN2\_CFG\_10 register (address 0Ah) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7	LN2_HD	R	-	high density
4 to 0	LN2_CF[4:0]	R	-	number of control words per frame cycle

**Table 185. LN2\_CFG\_11 register (address 0Bh) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN2_RES1[7:0]	R	-	lane 2 reserved field

**Table 186. LN2\_CFG\_12 register (address 0Ch) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN2_RES2[7:0]	R	-	lane 2 reserved field

**Table 187. LN2\_CFG\_13 register (address 0Dh) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN2_FCHK[7:0]	R	-	lane 2 checksum

**Table 188. LN3\_CFG\_0 register (address 10h) bit description***Default settings are shown highlighted.*

Bit	Symbol	Access	Value	Description
7 to 0	LN3_DID[7:0]	R	-	lane 3 device ID

## 11. Package outline

HVQFN64: plastic thermal enhanced very thin quad flat package; no leads;  
64 terminals; body 9 x 9 x 0.85 mm

SOT804-3

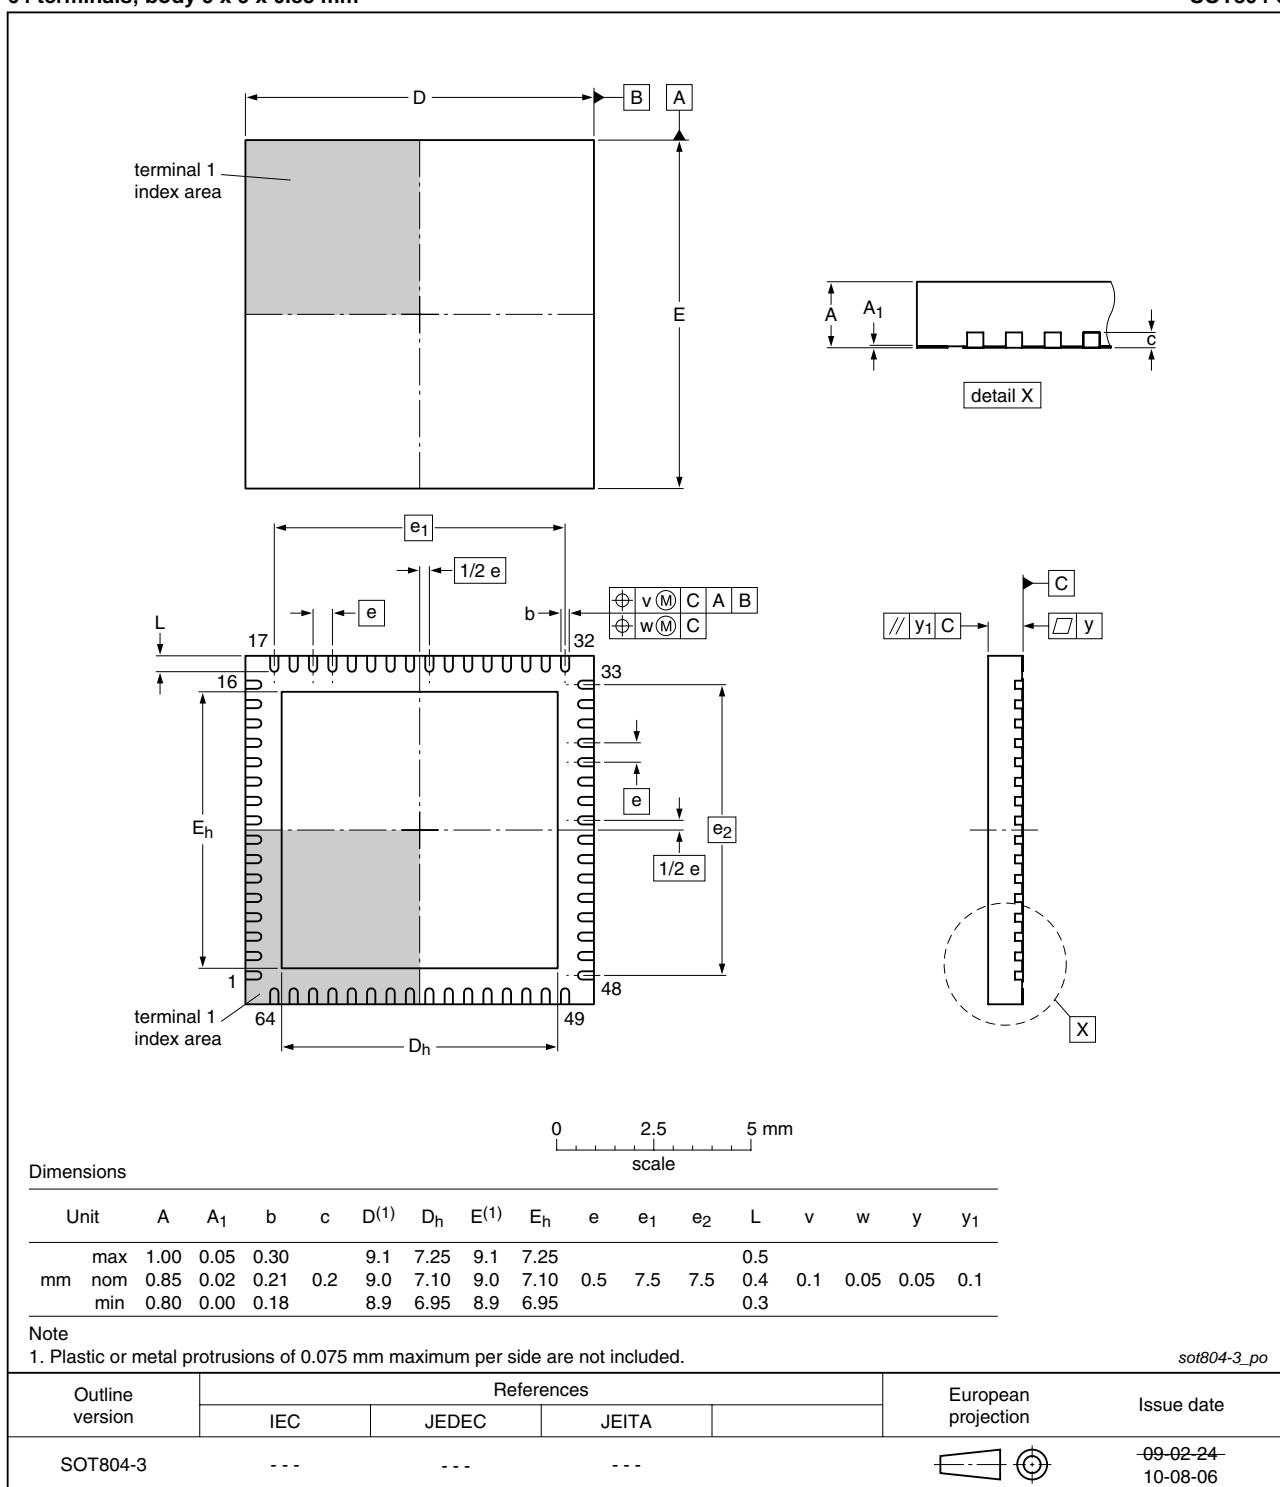

Fig 27. Package outline SOT804-3 (HVQFN64)

## 12. Abbreviations

**Table 203. Abbreviations**

Acronym	Description
AQM	Analog Quadrature Modulator
BW	BandWidth
BWA	Broadband Wireless Access
CDMA	Code Division Multiple Access
CML	Current Mode Logic
CMOS	Complementary Metal Oxide Semiconductor
DAC	Digital-to-Analog Converter
EDGE	Enhanced Data rates for GSM Evolution
FIR	Finite Impulse Response
GSM	Global System for Mobile communications
IF	Intermediate Frequency
IMD3	third order InterModulation Product
LMDS	Local Multipoint Distribution Service
LTE	Long Term Evolution
LVDS	Low-voltage Differential Signaling
NCO	Numerically Controlled Oscillator
NMOS	Negative Metal-Oxide Semiconductor
PLL	Phase-Locked Loop
SERDES	Serializer/Deserializer
SFDR	Spurious Free Dynamic Range
SPI	Serial Peripheral Interface
TD-SCDMA	Time Division-Synchronous Code Division Multiple Access
WCDMA	Wideband Code Division Multiple Access
WiMax	Worldwide interoperability for Microwave Access
WLL	Wireless Local Loop

## 13. Revision history

**Table 204. Revision history**

Document ID	Release date	Data sheet status	Change notice	Supersedes
DAC1408D650 v.2	20100811	Preliminary data sheet	-	DAC1408D650_1
Modifications:	<ul style="list-style-type: none"><li>Template upgraded to Rev 2.12.0 including revised legal information.</li><li>Text and drawings updated throughout entire data sheet.</li></ul>			
DAC1408D650_1	20090526	Objective data sheet	-	-

## 14. Legal information

### 14.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 14.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

malfuction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from national authorities.

### 14.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or

**Non-automotive qualified products** — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.
