

Converter IC's: A/D

INTEGRATED-CIRCUIT ANALOG-TO-DIGITAL CONVERTERS

The Analog Devices' product line of IC A/D converters consists of 12 products. Cost/performance varies from 4ms 3-digit BCD conversions to 12-bit conversions in 2.2 μ s.

The new AD7574 provides 8 bits in 15 μ s and uses only 25mW of power from a single 5V supply. This single-chip CMOS device interfaces directly to microprocessors and has no missing codes over its rated operating temperature range.

The new 10- and 12-bit AD ADC80's are improved reduced chip-count (high reliability) replacements for the other ADC80 devices. Complete with internal reference, the AD ADC80 performs 12-bit conversion in 25 μ s.

The AD574 is a complete μ P-compatible 2-chip, 12-bit successive-approximation ADC. A built-in clock, comparator, reference, and 3-state output buffers allow direct interface with 8-, 12-, or 16-bit microprocessors. The use of laser-trimmed, thin-film resistors guarantees no missing codes over commercial and military temperature ranges.

The AD570 and AD571 are complete 8- and 10-bit monolithic A/D converters, using I²L successive-approximation logic. The clock, voltage reference, laser-trimmed DAC, and 3-state buffers are included on the chip. No external components are needed for full-accuracy 8- and 10-bit conversion in 25 μ s.

The AD572, a complete 12-bit hybrid IC successive-approximation A/D converter, includes internal clock, reference comparator, and buffer amplifier. It utilizes MSI digital and linear monolithic chips and active laser trimming of high-stability thin-film resistors to provide modular performance, flexibility, and ease of use, combined with IC size, price and reliability.

The AD7550 is a 13-bit CMOS integrating A/D converter utilizing the patented "quad-slope" conversion technique. Three-state data output lines and byte control are provided for direct interfacing with microprocessors.

The AD7570 is a monolithic CMOS 10-bit successive-approximation A/D converter that requires only an external reference, comparator and passive clock components. Three-state data outputs simplify interfacing to microprocessors.

The AD2020 is a low-cost 3-BCD-digital I²L integrating A/D converter chip for implementing a complete 3-digit DPM/DVM with only ten external components. It includes an on-chip reference and consumes only 50mW of power from a single +5V supply.

The HAS family of hybrid IC A to D converters offers extremely high speed without sacrificing precision. These 8-, 10- and 12-bit devices convert in a guaranteed 1.5 μ s, 1.7 μ s and 2.8 μ s respectively and guarantee no missing codes over temperature.
