

General Description

The SM840021 synthesizer was designed for Ethernet applications. This clock synthesizer is optimized for 125MHz using a standard 25MHz fundamental parallel resonant crystal, with unparalleled stability and accuracy over the full operating range. The SM840021 design includes a unique power reduction methodology, along with a patented RotaryWave™ architecture that provides a very stable clock with very low noise for optimized performance yielding an overall improved Bit Error Rate (BER) and improved waveform integrity.

Datasheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Features

- Generates an optimized 125MHz LVCMOS Output
- Integrated loop filter components
- RMS Phase Jitter: 250 fs (typ)
- Operates with either a 3.3V or 2.5V supply
- Power consumption is <77mA @ 3.3V
- Input frequency: 25MHz parallel resonant crystal
- Output frequency: 125MHz
- Temperature range: -40°C to +75°C
- Green, RoHS-compliant and PFOS-compliant
- Available in 8-pin TSSOP package

Applications

- Gigabit Ethernet
- Datacom/Telecom
- Ethernet Switch

Functional Description

The SM840021 provides a high performance and high accuracy solution for a precision clock source at 125MHz derived, from a low cost 25MHz Xtal.

The design of the SM840021 consumes very low power in the PLL due to a proprietary technology in the VCO and the associated dividers. The output divider is fixed at $\div 26$, and the feedback divider is also fixed at $\div 130$

providing a precision clock at 125MHz. Duty Cycle is inherently improved to provide a tight control and stability on this critical specification.

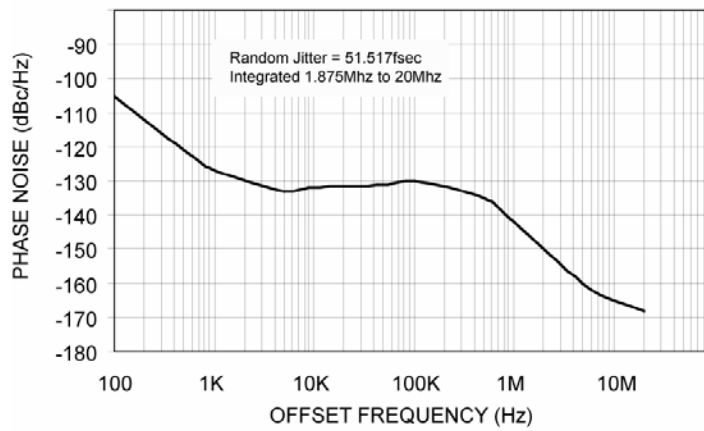

The device provides improved specifications for Duty Cycle, Jitter, Phase Noise, Power Consumption, and noise sensitivity. Additionally, the SM840021 will operate at either 3.3V or 2.5V supplies.

Power Supply Filtering

The SM840021 provides separate power supply pins to isolate any high switching noise from outputs to internal core blocks. VDD and VDDA should be individually connected to the power plane through vias. Bypass capacitors should be used for each pin. Figure 2 illustrates how the power supply filter for 3.3 V and 2.5 V is configured.

Crystal Loading

Crystal Recommendations

This device requires a parallel resonance crystal. Substituting a series resonance crystal will cause this device to operate at the wrong frequency and violate the ppm specifications.

To achieve low ppm error, the total capacitance of the crystal must be considered in order to calculate appropriate capacitive loading (CL).

Load Capacitance at each side: Trim Capacitance = $C_t = (2 \cdot CL - (C_b + C_d))$

CL: Crystal load capacitance. Defined by manufacturer

Ct: External trim capacitors. (Trimmed CL Load capacitance to get the right ppm)

Cb: Board capacitance (vias, traces, etc.)

Cd: Internal capacitance of the device (lead frame, bond wires, pin, etc.)

Equivalent Series Resistance (ESR) Max.	Cut	Load Cap.	Shunt Cap. Max.	Drive Max.
70Ω	AT		7pF	0.1mW

Crystal Input Interface

Total capacitance seen by crystal = $CL =$

$$\frac{1}{\frac{1}{(Ct1 + Cb1 + Cd1)} + \frac{1}{(Ct2 + Cb2 + Cd2)}}$$

Example:

$CL = 18\text{pF}, Cb = 2\text{pF}, Cd = 4\text{pF}$

Trim Cap = $Ct = 2 (18\text{pF}) - (2\text{pF} + 4\text{pF}) = 30\text{pF}$

The SM840021 has been characterized with 25MHz, 18pF parallel resonant crystal. The trim capacitors Ct1 and Ct2 were optimized to minimize the ppm error.

To minimize the board capacitance, a short trace from pin to crystal footprint without vias is desirable. It is preferable to have ground shielding or distance between the crystal traces and noisy signals on the board.
