General Description

The NT3980 is a data driver IC for a color TFT LCD panel, XGA and SXGA applications. It receives 8 bit per-pixel digital display data,and generates output voltage for 256 grayscales ,enabling a maximum of 16.77M display colors . For better performance, dot inversion and a wide range voltage output, 10V, are designed in this chip, and for reducing EMI, data inversion control is used. This chip supplies 10 sections of voltage reference for Gamma correction.

Pin Description

Designation	I/O	Description
D07 ~ D00 D17 ~ D10 D27 ~ D20 D37 ~ D30 D47 ~ D40 D57 ~ D50	I	Data input. For six 8-bit data,2 pixels, of color data (R, G, B) DX7 : MSB; DX0 : LSB
REV1 REV2	I	Controls whether data are inverted or not. When "REVx"=1 the data will be inverted. EX. "00" → "FF", "07" → "F8", "15" → "EA", and so on. REV1: control D0x to D2x ,REV2: control D3x to D5x . (These two pins can be connected together on TCP.)
V1 ~ V10	I	Gamma correction reference voltage. The voltage of these pins must be AVSS< V10< V9< V8<V7<V6; V5<V4<V3<V2<V1< AVDD
OUT1 ~ OUT384	O	Output drive signals;
SHL	I	Selects left or right shift; SHL="1" : DIO1→OUT1,2,3,4,5,6→OUT7,8,9,10,11,12--→OUT379,380,381,382,383,384= DIO2 SHL="0" : DIO1=OUT1,2,3,4,5,6←OUT7,8,9,10,11,12←-- OUT379,380,381,382,383,384←DIO2
DIO1 DIO2	I/O	Start pulse signal input/output When SHL is applied high (SHL="1"), a start high-pulse on DIO1 is latched at the rising edge of the CLK. Then the data are latched serially onto internal latches at the rising edge of the CLK. After all line latches are filled with data, 64 clocks, a pulse is shifted out through the DIO2 pin at the rising edge of the CLK. This function can cascade two or more devices for dot expansion. In normal applications, the DIO2 signal of the first device is connected to the DIO1 of the second stage, the DIO2 of the second one is connected to the DIO1 of the third, and so on, like a daisy chain. In contrast, when SHL is applied low, a start pulse inputs on DIO2, and a pulse outputs through DIO1. *Remark : The input pulse-width of DIO1/2 may exceed 1 clock-cycle.
LD	I	Latches the polarity of outputs and switches the new data to outputs. 1.At the rising edge, the pin latches the "POL" signal to control the polarity of the outputs. 2.This pin also controls the switch of the line registers that switches the new incoming data to outputs. *Remark: The LD may switch the new data to outputs at anytime even if the line data are not completely full.
CLK	I	Clock input; latching data onto the line latches at the rising edge . After a start pulse input, display data latching is halted automatically after 64 clock cycles. *Remark: At least one CLK cycle is necessary during the high-level period of LD.
POL	I	Polarity selector for the dot-inversion control. Available at the rising edge of LD. "POL" value is latched at the rising edge of "LD" to control the polarity of the even or odd outputs. "POL=1" indicates that even outputs are of positive polarity with a voltage range from V1~V5, and odd outputs are of negative polarity with a voltage range from V6 to V10. On the other hand, if LD receives low level "POL", even outputs are of negative polarity and odd outputs are of positive polarity. POL=1: Even outputs range from V1 ~ V5 Odd outputs range from V6 ~ V10 POL=0: Even outputs range from V6 ~ V10 Odd outputs range from V1 ~ V5
AVDD	I	Power supply for analog circuit;
AVSS	I	Ground pin for analog circuit
Vcc	I	Power supply for digital circuit
GND	I	Ground pin for digital circuit

SHL	DIO1	DIO2	SHIFT
1	Input	Output	Right
0	Output	Input	Left

Power on/off sequence:
This IC is a high-voltage LCD driver, so it may be damaged by a large current flow when an incorrect power sequence is used. The recommended connection sequence is to first connect the logical power, Vcc & GND and then connect the drive power, AVDD&AVSS with V1~V10. When shutting off the power, first shut off the drive power and then the logic system, or turn off all power simultaneously.

Relationship between input data and output voltage
The figure below shows the relationship among the input data and the output voltage and the polarity. The range of V1~V5 is for positive polarity, and V6 ~ V10 for negative polarity. Please refer to the following page to get the relative resistors value and voltage calculation method.
