1024 x 4 CMOS RAM

Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- Low Power Standby 125 μ W Max
- Low Power Operation35mW/MHz Max
- Data Retention at 2.0V Min
- TTL Compatible Input/Output
- Common Data Input/Output
- Three-State Output
- Standard JEDEC Pinout
- Fast Access Time 120/200ns Max
- 18 Pin Package for High Density
- Gated Inputs - No Pull Up or Pull Down Resistors Required
- On-Chip Address Register

Description

The HM-6514/883 is a 1024 x 4 static CMOS RAM fabricated using self-aligned silicon gate technology. The device utilizes synchronous circuitry to achieve high performance and low power operation.

On chip latches are provided for addresses allowing efficient interfacing with microprocessor systems. The data output can be forced to a high impedance state for use in expanded memory arrays.

Gated inputs allow lower operating current and also eliminates the need for pull up or pull down resistors. The HM-6514/883 is fully static RAM and may be maintained in any state for an indefinite period of time.

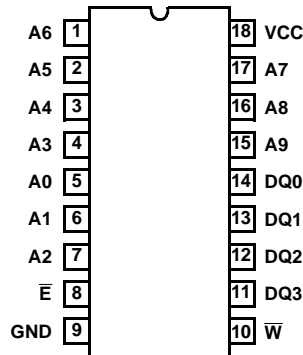

Data retention supply voltage and supply current are guaranteed over temperature.

Absolute Maximum Ratings

Supply Voltage +7.0V
 Input, Output or I/O Voltage GND -0.3V to VCC +0.3V
 ESD Classification Class 1

Thermal Information

Thermal Resistance θ_{JA} θ_{JC}
 CERDIP Package 75°C/W 15°C/W
 Maximum Storage Temperature Range -65°C to +150°C
 Maximum Junction Temperature +175°C
 Maximum Lead Temperature (Soldering 10s) +300°C

Die Characteristics

Gate Count 6910 Gates

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Operating Conditions

Operating Voltage Range +4.5V to +5.5V Input High Voltage VCC -2.0V to VCC
 Operating Temperature Range -55°C to +125°C Input Rise and Fall Time 40ns Max
 Input Low Voltage 0V to +0.8V

TABLE 1. HM-6514/883 DC ELECTRICAL PERFORMANCE SPECIFICATIONS

Device Guaranteed and 100% Tested

PARAMETER	SYMBOL	(NOTE 1) CONDITIONS	GROUP A SUBGROUPS	TEMPERATURE	LIMITS		UNITS
					MIN	MAX	
Output Low Voltage	VOL	VCC = 4.5V IOL = 3.2mA	1, 2, 3	-55°C ≤ T _A ≤ +125°C	-	0.4	V

Timing Waveforms

FIGURE 1. READ CYCLE

TRUTH TABLE

TIME REFERENCE	INPUTS			DATA I/O DQ	FUNCTION
	\bar{E}	\bar{W}	A		
-1	H	X	X	Z	Memory Disabled
0		H	V	Z	Cycle Begins, Addresses are Latched
1	L	H	X	X	Output Enabled
2	L	H	X	V	Output Valid
3		H	X	V	Read Accomplished
4	H	X	X	Z	Prepare for Next Cycle (Same as -1)
5		H	V	Z	Cycle Ends, Next Cycle Begins (Same as 0)

The address information is latched in the on-chip registers on the falling edge of \bar{E} (T = 0). Minimum address set up and hold time requirements must be met. After the required hold time, the addresses may change state without affecting device operation. During time (T = 1) the output becomes

enabled but data is not valid until during time (T = 2). \bar{W} must remain high throughout the read cycle. After the output data has been read, \bar{E} may return high (T = 3). This will disable the output buffer and all inputs, and ready the RAM for the next memory cycle (T = 4).

Timing Waveforms (Continued)

FIGURE 2. WRITE CYCLE

TRUTH TABLE

TIME REFERENCE	INPUTS			DQ	FUNCTION
	\bar{E}	\bar{W}	A		
-1	H	X	X	Z	Memory Disabled
0		X	V	Z	Cycle Begins, Addresses are Latched
1	L	L	X	Z	Write Period Begins
2	L		X	V	Data In is Written
3		H	X	Z	Write Completed
4	H	X	X	Z	Prepare for Next Cycle (Same as -1)
5		X	V	Z	Cycle Ends, Next Cycle Begins (Same as 0)

The write cycle is initiated by the falling edge of \bar{E} ($T = 0$), which latches the address information in the on-chip registers. There are two basic types of write cycles, which differ in the control of the common data-in/data-out bus.

Case 1: \bar{E} falls before \bar{W} falls

The output buffers may become enabled (reading) if \bar{E} falls before \bar{W} falls. \bar{W} is used to disable (three-state) the outputs so input data can be applied. TWLDV must be met to allow the \bar{W} signal time to disable the outputs before applying input data. Also, at the end of the cycle the outputs may become active if \bar{W} rises before \bar{E} . The RAM outputs and all inputs will three-state after \bar{E} rises (TEHQZ). In this type of write cycle TWLEL and TEHWH may be ignored.

Case 2: \bar{E} falls equal to or after \bar{W} falls, and \bar{E} rises before or equal to \bar{W} rising

This \bar{E} and \bar{W} control timing will guarantee that the data outputs will stay disabled throughout the cycle, thus simplifying the data input timing. TWLEL and TEHWH must be met, but TWLDV becomes meaningless and can be ignored. In this cycle TDVWH and TWHDX become TDVEH and TEHDX. In other words, reference data setup and hold times to the \bar{E} rising edge.

	IF	OBSERVE	IGNORE
Case 1	\bar{E} falls before \bar{W}	TWLDV	TWLEL
Case 2	\bar{E} falls after \bar{W} and \bar{E} rises before \bar{W}	TWLEL TEHWH	TWLDV TWHDX

If a series of consecutive write cycles are to be performed, \bar{W} may be held low until all desired locations have been written (an extension of Case 2).

Test Load Circuit
