

8K/16K x 9 Synchronous Dual-Port Static RAM

Features

- True dual-ported memory cells which allow simultaneous access of the same memory location
- Two Flow-Through/Pipelined devices
 - 8K x 9 organization (CY7C09159A)
 - 16K x 9 organization (CY7C09169A)
- Three Modes
 - Flow-Through
 - Pipelined
 - Burst
- Pipelined output mode on both ports allows fast 100-MHz cycle time
- 0.35-micron CMOS for optimum speed/power
- High-speed clock to data access 6.5^[1]/7.5/9/12 ns (max.)
- Low operating power
 - Active = 200 mA (typical)
 - Standby = 0.05 mA (typical)
- Fully synchronous interface for easier operation
- Burst counters increment addresses internally
 - Shorten cycle times
 - Minimize bus noise
 - Supported in Flow-Through and Pipelined modes
- Dual Chip Enables for easy depth expansion
- Automatic power-down
- Commercial and Industrial temperature ranges
- Available in 100-pin TQFP

Notes:

1. See page 6 for Load Conditions.
2. A₀-A₁₂ for 8K; A₀-A₁₃ for 16K.

Functional Description

The CY7C09159A and CY7C09169A are high-speed synchronous CMOS 8K and 16K x 9 dual-port static RAMs. Two ports are provided, permitting independent, simultaneous access for reads and writes to any location in memory^[3]. Registers on control, address, and data lines allow for minimal set-up and hold times. In pipelined output mode, data is registered for decreased cycle time. Clock to data valid $t_{CD2} = 6.5 \text{ ns}^{[1]}$ (pipelined). Flow-through mode can also be used to bypass the pipelined output register to eliminate access latency. In flow-through mode data will be available $t_{CD1} = 15 \text{ ns}$ after the address is clocked into the device. Pipelined output or flow-through mode is selected via the FT/Pipe pin.

Each port contains a burst counter on the input address register. The internal write pulse width is independent of the LOW-to-HIGH transition of the clock signal. The internal write pulse is self-timed to allow the shortest possible cycle times.

Note:

3. When simultaneously writing to the same location, final value cannot be guaranteed.

A HIGH on \overline{CE}_0 or LOW on CE_1 for one clock cycle will power down the internal circuitry to reduce the static power consumption. The use of multiple Chip Enables allows easier banking of multiple chips for depth expansion configurations. In the pipelined mode, one cycle is required with \overline{CE}_0 LOW and CE_1 HIGH to reactivate the outputs.

Counter enable inputs are provided to stall the operation of the address input and utilize the internal address generated by the internal counter for fast interleaved memory applications. A port's burst counter is loaded with the port's Address Strobe (ADS). When the port's Count Enable (\overline{CNTEN}) is asserted, the address counter will increment on each LOW-to-HIGH transition of that port's clock signal. This will read/write one word from/into each successive address location until \overline{CNTEN} is deasserted. The counter can address the entire memory array and will loop back to the start. Counter Reset (\overline{CNTRST}) is used to reset the burst counter.

All parts are available in 100-pin Thin Quad Plastic Flatpack (TQFP) packages.

Pin Configuration

100-Pin TQFP
(Top View)

Note:

- 4. This pin is NC for CY7C09159A.

Selection Guide

| | CY7C09159A CY7C09169A -6 ^[1] | CY7C09159A CY7C09169A -7 | CY7C09159A CY7C09169A -9 | CY7C09159A CY7C09169A -12 |
|---|---|--------------------------------|--------------------------------|---------------------------------|
| f_{MAX2} (MHz) (Pipelined) | 100 | 83 | 67 | 50 |
| Max. Access Time (ns) (Clock to Data, Pipelined) | 6.5 | 7.5 | 9 | 12 |
| Typical Operating Current I_{CC} (mA) | 250 | 235 | 215 | 195 |
| Typical Standby Current for I_{SB1} (mA) (Both Ports TTL Level) | 45 | 40 | 35 | 30 |
| Typical Standby Current for I_{SB3} (mA) (Both Ports CMOS Level) | 0.05 | 0.05 | 0.05 | 0.05 |

Pin Definitions

| Left Port | Right Port | Description |
|---------------------|---------------------|--|
| $A_{0L}-A_{13L}$ | $A_{0R}-A_{13R}$ | Address Inputs (A_0-A_{12} for 8K; A_0-A_{13} for 16K devices). |
| ADS_L | ADS_R | Address Strobe Input. Used as an address qualifier. This signal should be asserted LOW during normal read or write transactions. Asserting this signal LOW also loads the burst address counter with data present on the I/O pins. |
| CE_{0L}, CE_{1L} | CE_{0R}, CE_{1R} | Chip Enable Input. To select either the left or right port, both CE_0 AND CE_1 must be asserted to their active states ($CE_0 \leq V_{IL}$ and $CE_1 \geq V_{IH}$). |
| CLK_L | CLK_R | Clock Signal. This input can be free running or strobed. Maximum clock input rate is f_{MAX} . |
| $CNTEN_L$ | $CNTEN_R$ | Counter Enable Input. Asserting this signal LOW increments the burst address counter of its respective port on each rising edge of CLK. CNTEN is disabled if ADS or CNTRST are asserted LOW. |
| $CNTRST_L$ | $CNTRST_R$ | Counter Reset Input. Asserting this signal LOW resets the burst address counter of its respective port to zero. CNTRST is not disabled by asserting ADS or CNTEN. |
| $I/O_{0L}-I/O_{8L}$ | $I/O_{0R}-I/O_{8R}$ | Data Bus Input/Output ($I/O_0-I/O_7$ for x8 devices; $I/O_0-I/O_8$ for x9 devices). |
| OE_L | OE_R | Output Enable Input. This signal must be asserted LOW to enable the I/O data pins during read operations. |
| R/W_L | R/W_R | Read/Write Enable Input. This signal is asserted LOW to write to the dual port memory array. For read operations, assert this pin HIGH. |
| $FT/PIPE_L$ | $FT/PIPE_R$ | Flow-Through/Pipelined Select Input. For flow-through mode operation, assert this pin LOW. For pipelined mode operation, assert this pin HIGH. |
| GND | | Ground Input. |
| NC | | No Connect. |
| V_{CC} | | Power Input. |

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature -65°C to $+150^{\circ}\text{C}$

Ambient Temperature with Power Applied... -55°C to $+125^{\circ}\text{C}$

Supply Voltage to Ground Potential -0.3V to $+7.0\text{V}$

DC Voltage Applied to

Outputs in High Z State -0.5V to $+7.0\text{V}$

DC Input Voltage..... -0.5V to $+7.0\text{V}$

Note:

- Industrial Parts are available in CY7C09169A only.

Output Current into Outputs (LOW)..... 20 mA

Static Discharge Voltage $>2001\text{V}$

Latch-Up Current..... $>200\text{ mA}$

Operating Range

| Range | Ambient Temperature | V_{CC} |
|---------------------------|--|----------------------|
| Commercial | 0°C to $+70^{\circ}\text{C}$ | $5\text{V} \pm 10\%$ |
| Industrial ^[5] | -40°C to $+85^{\circ}\text{C}$ | $5\text{V} \pm 10\%$ |

Switching Waveforms
Read Cycle for Flow-Through Output ($\overline{FT}/PIPE = V_{IL}$)^[8, 9, 10, 11]

Read Cycle for Pipelined Operation ($\overline{FT}/PIPE = V_{IH}$)^[8, 9, 10, 11]

Notes:

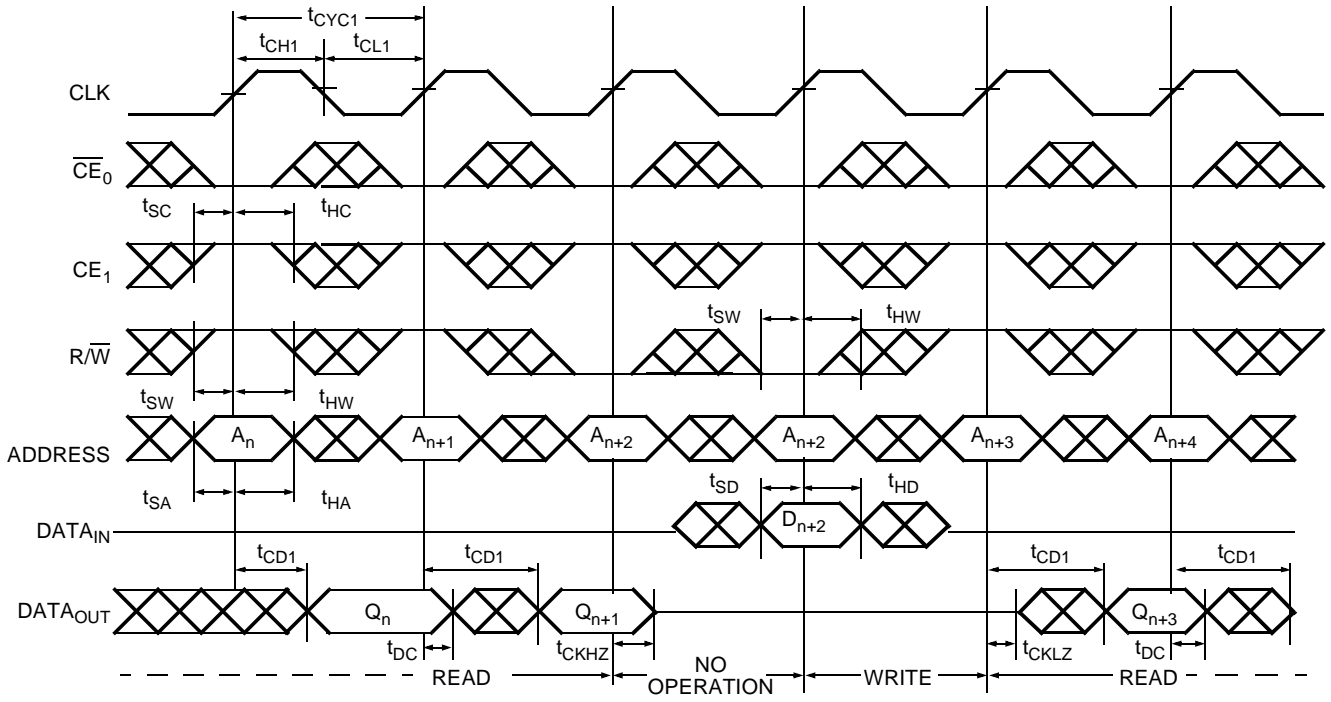

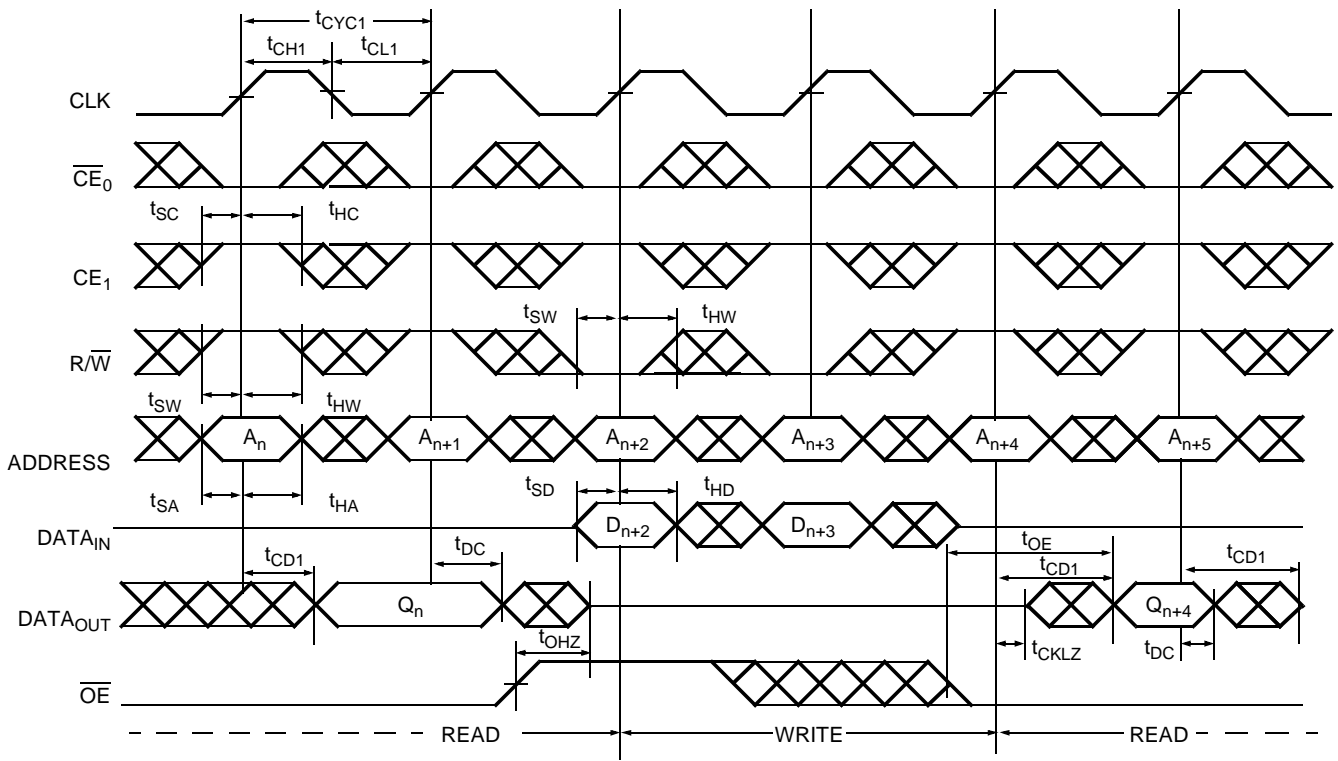

8. \overline{OE} is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
9. $ADS = V_{IL}$, $CNTEN$ and $CNTRST = V_{IH}$.
10. The output is disabled (high-impedance state) by $\overline{CE}_0 = V_{IH}$ or $CE_1 = V_{IL}$ following the next rising edge of the clock.
11. Addresses do not have to be accessed sequentially since $ADS = V_{IL}$ constantly loads the address on the rising edge of the CLK. Numbers are for reference only.

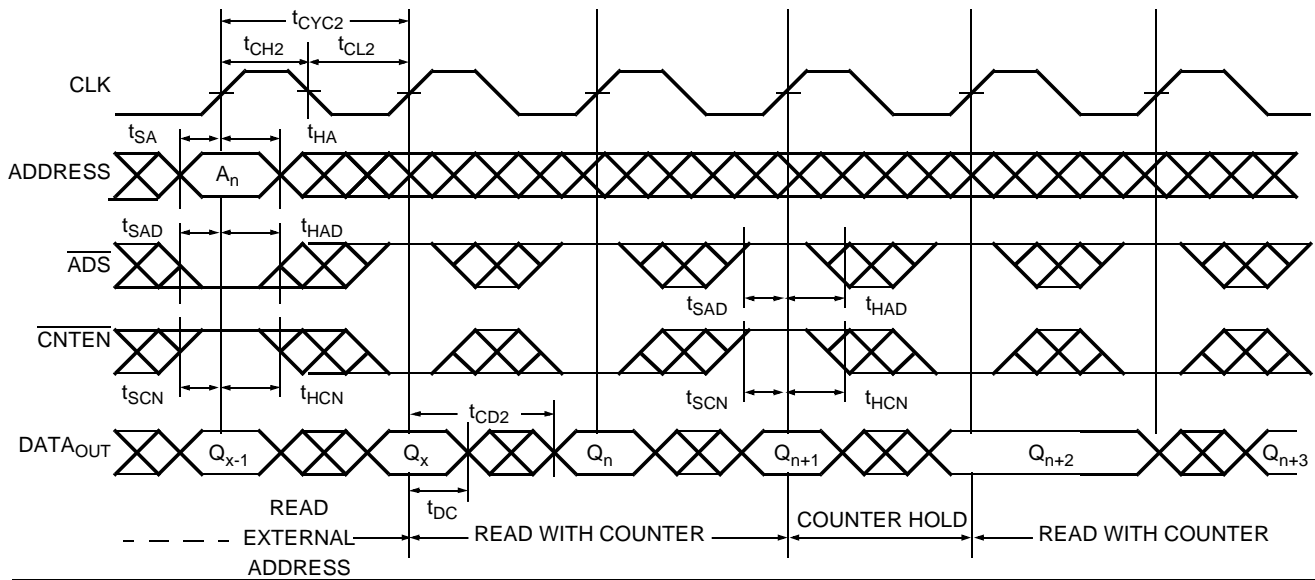

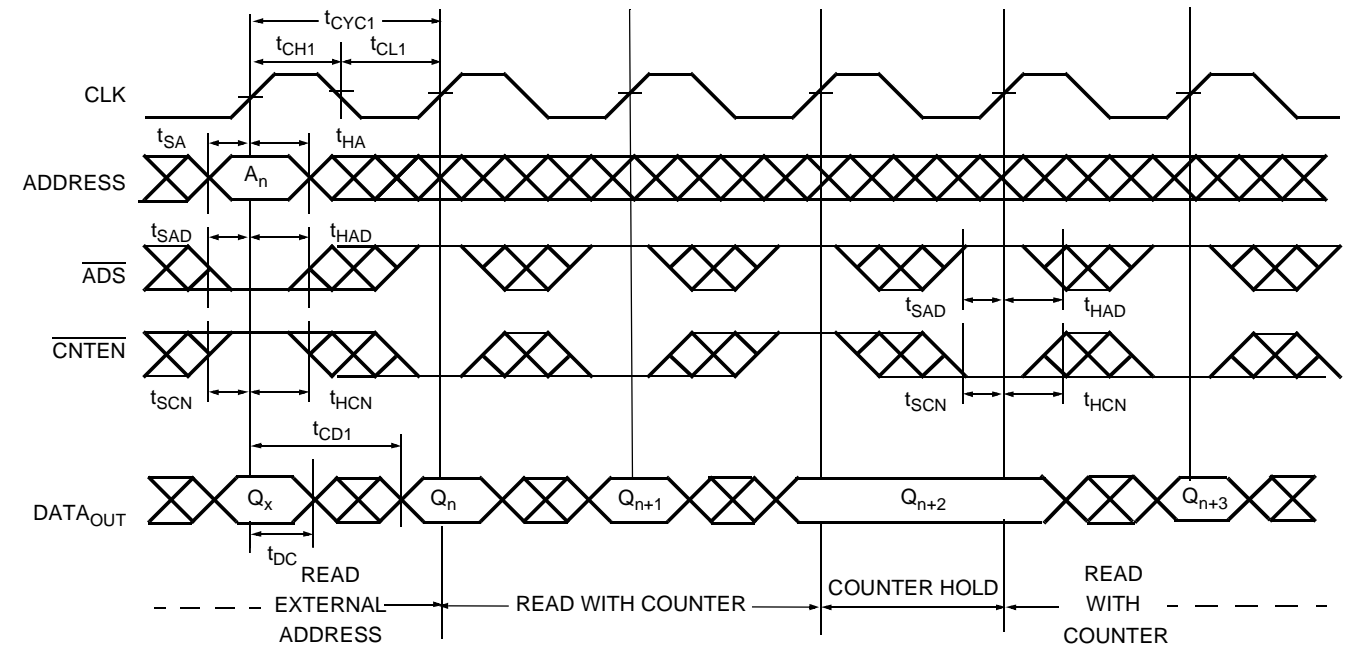

Switching Waveforms (continued)
Bank Select Pipelined Read^[12, 13]

Left Port Write to Flow-Through Right Port Read^[14, 15, 16, 17]

Notes:

12. In this depth expansion example, B1 represents Bank #1 and B2 is Bank #2. Each Bank consists of one Cypress dual-port device from this data sheet.
 $ADDRESS_{(B1)} = ADDRESS_{(B2)}$.
13. \overline{OE} and $ADS = V_{IL}$; $CE_{1(B1)}$, $CE_{1(B2)}$, R/\overline{W} , \overline{CNTEN} , and $\overline{CNTRST} = V_{IH}$.
14. The same waveforms apply for a right port write to flow-through left port read.
15. \overline{CE}_0 and $ADS = V_{IL}$; CE_1 , \overline{CNTEN} , and $\overline{CNTRST} = V_{IH}$.
16. $\overline{OE} = V_{IL}$ for the right port, which is being read from. $\overline{OE} = V_{IH}$ for the left port, which is being written to.
17. If $t_{CCS} \leq$ maximum specified, then data from right port READ is not valid until the maximum specified for t_{CWDD} . If $t_{CCS} >$ maximum specified, then data is not valid until $t_{CCS} + t_{CD1}$. t_{CWDD} does not apply in this case.

Switching Waveforms (continued)
Pipelined Read-to-Write-to-Read ($\overline{OE} = V_{IL}$)^[11, 15, 18, 19]

Pipelined Read-to-Write-to-Read (\overline{OE} Controlled)^[11, 15, 18, 19]

Notes:

18. Output state (HIGH, LOW, or High-Impedance) is determined by the previous cycle control signals.
19. During "No operation," data in memory at the selected address may be corrupted and should be rewritten to ensure data integrity.

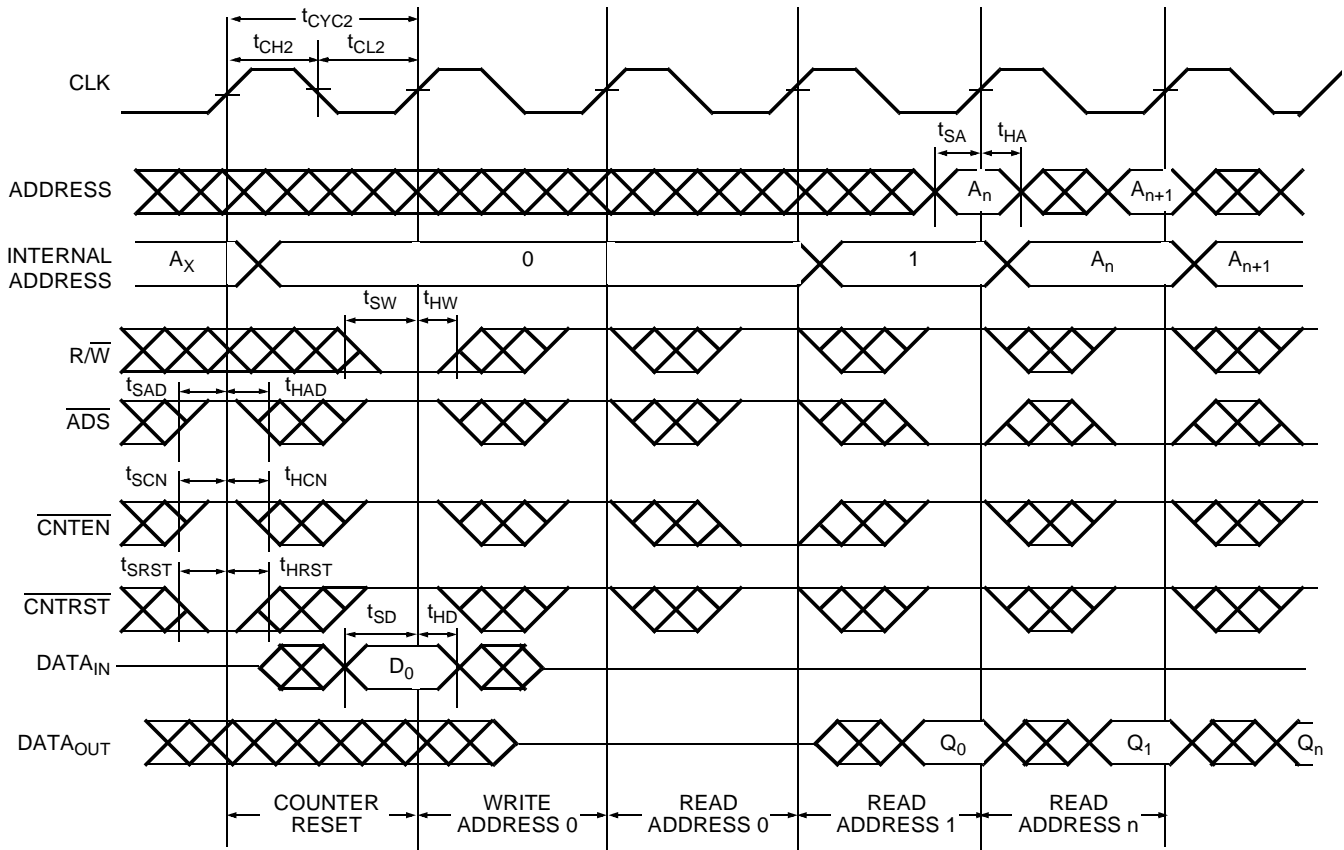

Switching Waveforms (continued)
Flow-Through Read-to-Write-to-Read ($\overline{OE} = V_{IL}$)^[9, 11, 15, 18]

Flow-Through Read-to-Write-to-Read (\overline{OE} Controlled)^[9, 11, 15, 18]

Switching Waveforms (continued)
Pipelined Read with Address Counter Advance^[20]

Flow-Through Read with Address Counter Advance^[20]

Note:
 20. $\overline{\text{CE}}_0$ and $\overline{\text{OE}} = V_{\text{IL}}$; CE_1 , $\text{R}/\overline{\text{W}}$ and $\overline{\text{CNTRST}} = V_{\text{IH}}$.

Switching Waveforms (continued)
Write with Address Counter Advance (Flow-Through or Pipelined Outputs)^[21, 22]

Notes:

21. \overline{CE}_0 and $R/\overline{W} = V_{IL}$; CE_1 and $\overline{CNTNST} = V_{IH}$.
22. The "Internal Address" is equal to the "External Address" when $\overline{ADS} = V_{IL}$ and equals the counter output when $\overline{ADS} = V_{IH}$.

Switching Waveforms (continued)
Counter Reset (Pipelined Outputs)^[11, 18, 23, 24]

Notes:

23. $\overline{CE}_0 = V_{IL}$; $CE_1 = V_{IH}$.

24. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset.

Read/Write and Enable Operation^[25, 26, 27]

| Inputs | | | | | Outputs | Operation |
|--------|---|-----------------|-----------------|-----|------------------------------------|----------------------------|
| OE | CLK | CE ₀ | CE ₁ | R/W | I/O ₀ –I/O ₈ | |
| X |  | H | X | X | High-Z | Deselected ^[28] |
| X |  | X | L | X | High-Z | Deselected ^[28] |
| X |  | L | H | L | D _{IN} | Write |
| L |  | L | H | H | D _{OUT} | Read ^[28] |
| H | X | L | H | X | High-Z | Outputs Disabled |

Address Counter Control Operation^[25, 29, 30, 31]

| Address | Previous Address | CLK | $\overline{\text{ADS}}$ | $\overline{\text{CNTEN}}$ | $\overline{\text{CNRST}}$ | I/O | Mode | Operation |
|----------------|------------------|---|-------------------------|---------------------------|---------------------------|-----------------------|-----------|---|
| X | X |  | X | X | L | D _{out(0)} | Reset | Counter Reset to Address 0 |
| A _n | X |  | L | X | H | D _{out(n)} | Load | Address Load into Counter |
| X | A _n |  | H | H | H | D _{out(n)} | Hold | External Address Blocked—Counter Disabled |
| X | A _n |  | H | L | H | D _{out(n+1)} | Increment | Counter Enabled—Internal Address Generation |

Notes:

25. "X" = "Don't Care," "H" = V_{IH}, "L" = V_{IL}.
26. $\overline{\text{ADS}}$, $\overline{\text{CNTEN}}$, $\overline{\text{CNRST}}$ = "Don't Care."
27. OE is an asynchronous input signal.
28. When CE changes state in the pipelined mode, deselection and read happen in the following clock cycle.
29. CE₀ and OE = V_{IL}; CE₁ and R/W = V_{IH}.
30. Data shown for flow-through mode; pipelined mode output will be delayed by one cycle.
31. Counter operation is independent of CE₀ and CE₁.
