**16 M-BIT DYNAMIC RAM  
4 M-WORD BY 4-BIT, EDO**

## Description

The  $\mu$ PD42S16405, 4216405 are 4,194,304 words by 4 bits CMOS dynamic RAMs with optional EDO.

EDO is a kind of the page mode and is useful for the read operation.

Besides, the  $\mu$ PD42S16405 can execute  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  self refresh.

The  $\mu$ PD42S16405, 4216405 are packaged in 26-pin plastic TSOP (II) and 26-pin plastic SOJ.

## Features

- EDO (Hyper page mode)
- 4,194,304 words by 4 bits organization
- Single +5.0 V  $\pm 10\%$  power supply
- Fast access and cycle time

Part number	Power consumption Active (MAX.)	Access time (MAX.)	R/W cycle time (MIN.)	EDO (Hyper page mode) cycle time (MIN.)
$\mu$ PD42S16405-50, 4216405-50	550 mW	50 ns	84 ns	20 ns
$\mu$ PD42S16405-60, 4216405-60	495 mW	60 ns	104 ns	25 ns
$\mu$ PD42S16405-70, 4216405-70	440 mW	70 ns	124 ns	30 ns

- $\mu$ PD42S16405 can execute  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  self refresh

## Block Diagram

### Input/Output Pin Functions

The  $\mu$ PD42S16405, 4216405 have input pins  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ ,  $\overline{\text{WE}}$ ,  $\overline{\text{OE}}$ , A0 to A11 and input/output pins I/O1 to I/O4.

Pin name	Input/Output	Function
RAS (Row address strobe)	Input	$\overline{\text{RAS}}$ activates the sense amplifier by latching a row address and selecting a corresponding word line. It refreshes memory cell array of one line selected by the row address. It also selects the following function. <ul style="list-style-type: none"><li>• <math>\overline{\text{CAS}}</math> before <math>\overline{\text{RAS}}</math> refresh</li></ul>
CAS (Column address strobe)	Input	$\overline{\text{CAS}}$ activates data input/output circuit by latching column address and selecting a digit line connected with the sense amplifier.
A0 to A11 (Address inputs)	Input	Address bus. Input total 22-bit of address signal, upper 12-bit and lower 10-bit in sequence (address multiplex method). Therefore, one word is selected from 4,194,304-word by 4-bit memory cell array. In actual operation, latch row address by specifying row address and activating RAS. Then, switch the address bus to column address and activate $\overline{\text{CAS}}$ . Each address is taken into the device when $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are activated. Therefore, the address input setup time ( $t_{ASR}$ , $t_{ASC}$ ) and hold time ( $t_{RAH}$ , $t_{CAH}$ ) are specified for the activation of RAS and CAS.
$\overline{\text{WE}}$ (Write enable)	Input	Write control signal. Write operation is executed by activating $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ .
$\overline{\text{OE}}$ (Output enable)	Input	Read control signal. Read operation can be executed by activating $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ and $\overline{\text{OE}}$ . If $\overline{\text{WE}}$ is activated during read operation, $\overline{\text{OE}}$ is to be ineffective in the device. Therefore, read operation cannot be executed.
I/O1 to I/O4 (Data inputs/outputs)	Input/Output	4-bit data bus. I/O1 to I/O4 are used to input/output data.

## ★ Hyper Page Mode (EDO)

The hyper page mode (EDO) is a kind of page mode with enhanced features. The two major features of the hyper page mode (EDO) are as follows.

### 1. Data output time is extended.

In the hyper page mode (EDO), the output data is held to the next  $\overline{\text{CAS}}$  cycle's falling edge, instead of the rising edge. For this reason, valid data output time in the hyper page mode (EDO) is extended compared with the fast page mode (= data extend function). In the fast page mode, the data output time becomes shorter as the  $\overline{\text{CAS}}$  cycle time becomes shorter. Therefore, in the hyper page mode (EDO), the timing margin in read cycle is larger than that of the fast page mode even if the  $\overline{\text{CAS}}$  cycle time becomes shorter.

### 2. The $\overline{\text{CAS}}$ cycle time in the hyper page mode (EDO) is shorter than that in the fast page mode.

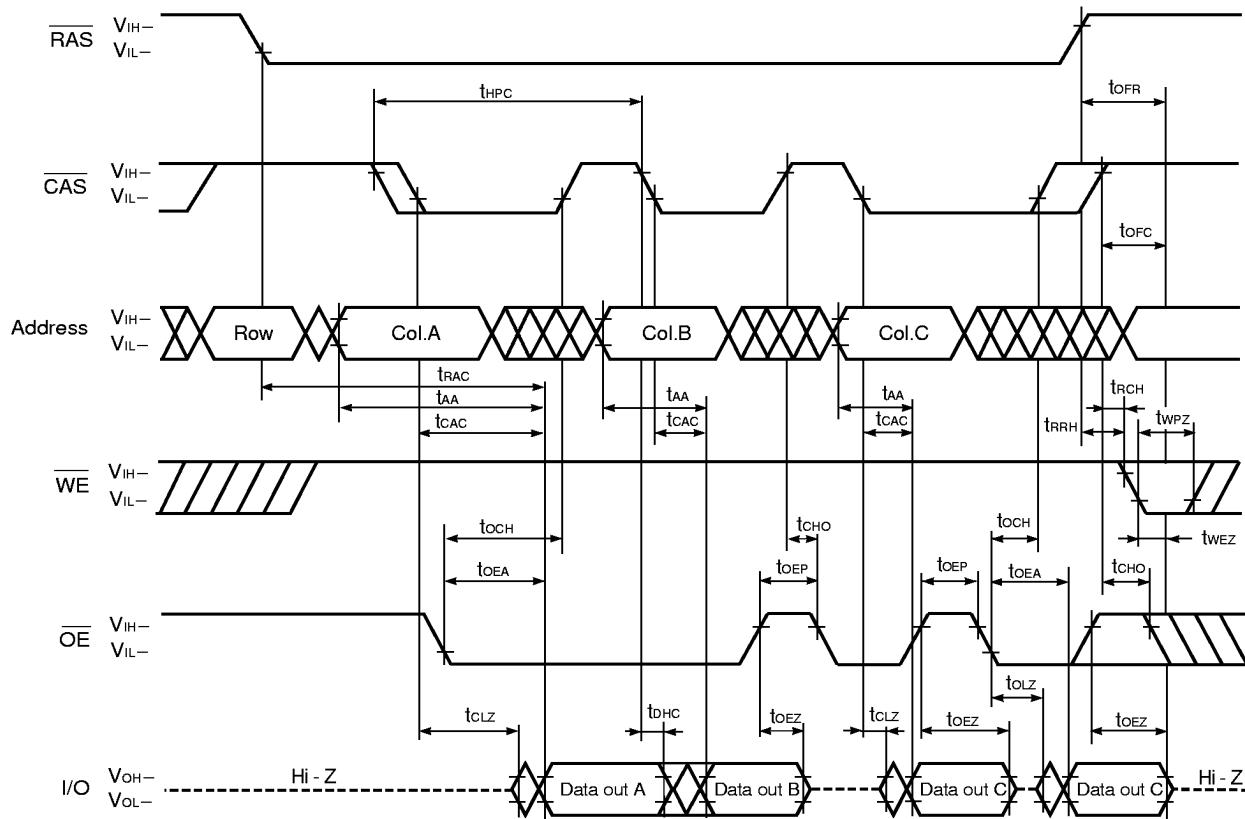

In the hyper page mode (EDO), due to the data extend function, the  $\overline{\text{CAS}}$  cycle time can be shorter than in the fast page mode if the timing margin is the same.

Taking a device whose  $t_{RAC}$  is 60 ns as an example, the  $\overline{\text{CAS}}$  cycle time in the fast page mode is 25 ns while that in the fast page mode is 40 ns.

In the hyper page mode (EDO), read (data out) and write (data in) cycles can be executed repeatedly during one  $\overline{\text{RAS}}$  cycle. The hyper page mode (EDO) allows both read and write operations during one cycle.

The following shows a part of the hyper page mode (EDO) read cycle. Specifications to be observed are described in the next page.

**Hyper Page Mode (EDO) Read Cycle**

**Cautions when using the hyper page mode (EDO)**

1.  $\overline{\text{CAS}}$  access should be used to operate  $t_{HPC}$  at the MIN. value.
2. To make I/Os to Hi-Z in read cycle, it is necessary to control  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ ,  $\overline{\text{WE}}$ ,  $\overline{\text{OE}}$  as follows. The effective specification depends on the state of each signal.
  - (1) Both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  are inactive (at the end of read cycle)  
 $\overline{\text{WE}}$ : inactive,  $\overline{\text{OE}}$ : active  
 $t_{OFC}$  is effective when  $\overline{\text{RAS}}$  is inactivated before  $\overline{\text{CAS}}$  is inactivated.  
 $t_{OFR}$  is effective when  $\overline{\text{CAS}}$  is inactivated before  $\overline{\text{RAS}}$  is inactivated.  
The slower of  $t_{OFC}$  and  $t_{OFR}$  becomes effective.
  - (2) Both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  are active or either  $\overline{\text{RAS}}$  or  $\overline{\text{CAS}}$  is active (in read cycle)  
 $\overline{\text{WE}}$ ,  $\overline{\text{OE}}$ : inactive .....  $t_{EZ}$  is effective.  
Both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  are inactive or  $\overline{\text{RAS}}$  is active and  $\overline{\text{CAS}}$  is inactive (at the end of read cycle)  
 $\overline{\text{WE}}$ ,  $\overline{\text{OE}}$ : active and either  $t_{RRH}$  or  $t_{RCH}$  must be met .....  $t_{EZ}$  and  $t_{WPZ}$  are effective.  
The faster of  $t_{EZ}$  and  $t_{WPZ}$  becomes effective.  
The faster of (1) and (2) becomes effective.
3. In read cycle, the effective specification depends on the state of  $\overline{\text{CAS}}$  signal when controlling data output with the  $\overline{\text{OE}}$  signal.
  - (1)  $\overline{\text{CAS}}$ : inactive,  $\overline{\text{OE}}$ : active .....  $t_{CHO}$  is effective.
  - (2)  $\overline{\text{CAS}}$ ,  $\overline{\text{OE}}$ : active .....  $t_{CH}$  is effective.

## Electrical Specifications

- All voltages are referenced to GND.
- After power up ( $V_{CC} \geq V_{CC(MIN.)}$ ), wait more than  $100 \mu s$  ( $\overline{RAS}$ ,  $\overline{CAS}$  inactive) and then, execute eight  $\overline{CAS}$  before  $\overline{RAS}$  or  $\overline{RAS}$  only refresh cycles as dummy cycles to initialize internal circuit.

## Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating	Unit
Voltage on any pin relative to GND	$V_T$		-1.0 to +7.0	V
Supply voltage	$V_{CC}$		-1.0 to +7.0	V
Output current	$I_O$		50	mA
Power dissipation	$P_D$		1	W
Operating ambient temperature	$T_A$		0 to +70	°C
Storage temperature	$T_{STG}$		-55 to +125	°C

**Caution** Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

1. Icc1, Icc3, Icc4, Icc5 and Icc6 depend on cycle rates ( $t_{RC}$  and  $t_{HPC}$ ).
  2. Specified values are obtained with outputs unloaded.
  3. Icc1 and Icc3 are measured assuming that address can be changed once or less during  $\overline{\text{RAS}} \leq V_{IL(\text{MAX.})}$  and  $\overline{\text{CAS}} \geq V_{IH(\text{MIN.})}$ .
  4. Icc3 is measured assuming that all column address inputs are held at either high or low.
  5. Icc4 is measured assuming that all column address inputs are switched only once during each hyper page (EDO) cycle.

**Notes** 1. In CAS before RAS refresh cycles, t<sub>TRAS(MAX.)</sub> is 100  $\mu$ s.

If 10  $\mu$ s < t<sub>TRAS</sub> < 100  $\mu$ s, RAS precharge time for CAS before RAS self refresh (t<sub>TRPS</sub>) is applied.

2. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from RAS
t <sub>TRAD</sub> ≤ t <sub>TRAD (MAX.)</sub> and t <sub>TRCD</sub> ≤ t <sub>TRCD (MAX.)</sub>	t <sub>RAC (MAX.)</sub>	t <sub>RAC (MAX.)</sub>
t <sub>TRAD</sub> > t <sub>TRAD (MAX.)</sub> and t <sub>TRCD</sub> ≤ t <sub>TRCD (MAX.)</sub>	t <sub>AA (MAX.)</sub>	t <sub>TRAD</sub> + t <sub>AA (MAX.)</sub>
t <sub>TRCD</sub> > t <sub>TRCD (MAX.)</sub>	t <sub>CAAC (MAX.)</sub>	t <sub>TRCD</sub> + t <sub>CAAC (MAX.)</sub>

t<sub>TRAD (MAX.)</sub> and t<sub>TRCD (MAX.)</sub> are specified as reference points only ; they are not restrictive operating parameters. They are used to determine which access time (t<sub>RAC</sub>, t<sub>AA</sub> or t<sub>CAAC</sub>) is to be used for finding out when output data will be available. Therefore, the input conditions t<sub>TRAD</sub> ≥ t<sub>TRAD (MAX.)</sub> and t<sub>TRCD</sub> ≥ t<sub>TRCD (MAX.)</sub> will not cause any operation problems.

3. t<sub>TCRP</sub> (MIN.) requirement is applied to RAS, CAS cycles.

4. This specification is applied only to the  $\mu$ PD42S16405.

- Notes**
1. t<sub>WP</sub> (MIN.) is applied to late write cycles or read modify write cycles. In early write cycles, t<sub>WCH</sub> (MIN.) should be met.
  2. If t<sub>WCS</sub>  $\geq$  t<sub>WCS</sub> (MIN.), the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle.
  3. t<sub>DS</sub> (MIN.) and t<sub>DH</sub> (MIN.) are referenced to the  $\overline{\text{CAS}}$  falling edge in early write cycles. In late write cycles and read modify write cycles, they are referenced to the  $\overline{\text{WE}}$  falling edge.

- Note**
1. If t<sub>WCS</sub>  $\geq$  t<sub>WCS</sub> (MIN.), the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle. If t<sub>RWD</sub>  $\geq$  t<sub>RWD</sub> (MIN.), t<sub>CWD</sub>  $\geq$  t<sub>CWD</sub> (MIN.), t<sub>AWD</sub>  $\geq$  t<sub>AWD</sub> (MIN.) and t<sub>CPWD</sub>  $\geq$  t<sub>CPWD</sub> (MIN.), the cycle is a read modify write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is met, the state of the data out is indeterminate.

**Notes** 1. t<sub>HPC</sub> (MIN.) is applied to CAS access.

2. If t<sub>WCS</sub> ≥ t<sub>WCS</sub> (MIN.), the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle. If t<sub>RWD</sub> ≥ t<sub>RWD</sub> (MIN.), t<sub>CWD</sub> ≥ t<sub>CWD</sub> (MIN.), t<sub>AWD</sub> ≥ t<sub>AWD</sub> (MIN.) and t<sub>CPWD</sub> ≥ t<sub>CPWD</sub> (MIN.), the cycle is a read modify write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is met, the state of the data out is indeterminate.

3. WE: inactive (in read cycle)

CAS: inactive, OE: active ..... t<sub>CH</sub> is effective.

CAS, OE: active ..... t<sub>CH</sub> is effective.

4. t<sub>OFC</sub> (MAX.), t<sub>OFR</sub> (MAX.) and t<sub>WEZ</sub> (MAX.) define the time when the output achieves the conditions of Hi-Z and is not referenced to V<sub>OH</sub> or V<sub>OL</sub>.

5. To make I/Os to Hi-Z in read cycle, it is necessary to control RAS, CAS, WE, OE as follows. The effective specification depends on state of each signal.

- (1) Both RAS and CAS are inactive (at the end of the read cycle)

WE: inactive, OE: active

t<sub>OFC</sub> is effective when RAS is inactivated before CAS is inactivated.

t<sub>OFR</sub> is effective when CAS is inactivated before RAS is inactivated.

The slower of t<sub>OFC</sub> and t<sub>OFR</sub> becomes effective.

- (2) Both RAS and CAS are active or either RAS or CAS is active (in read cycle)

WE, OE: inactive ..... t<sub>WEZ</sub> is effective.

Both RAS and CAS are inactive or RAS is active and CAS is inactive (at the end of read cycle)

WE, OE: active and either t<sub>RRH</sub> or t<sub>RC</sub> must be met ..... t<sub>WEZ</sub> and t<sub>WPZ</sub> are effective.

The faster of t<sub>WEZ</sub> and t<sub>WPZ</sub> becomes effective.

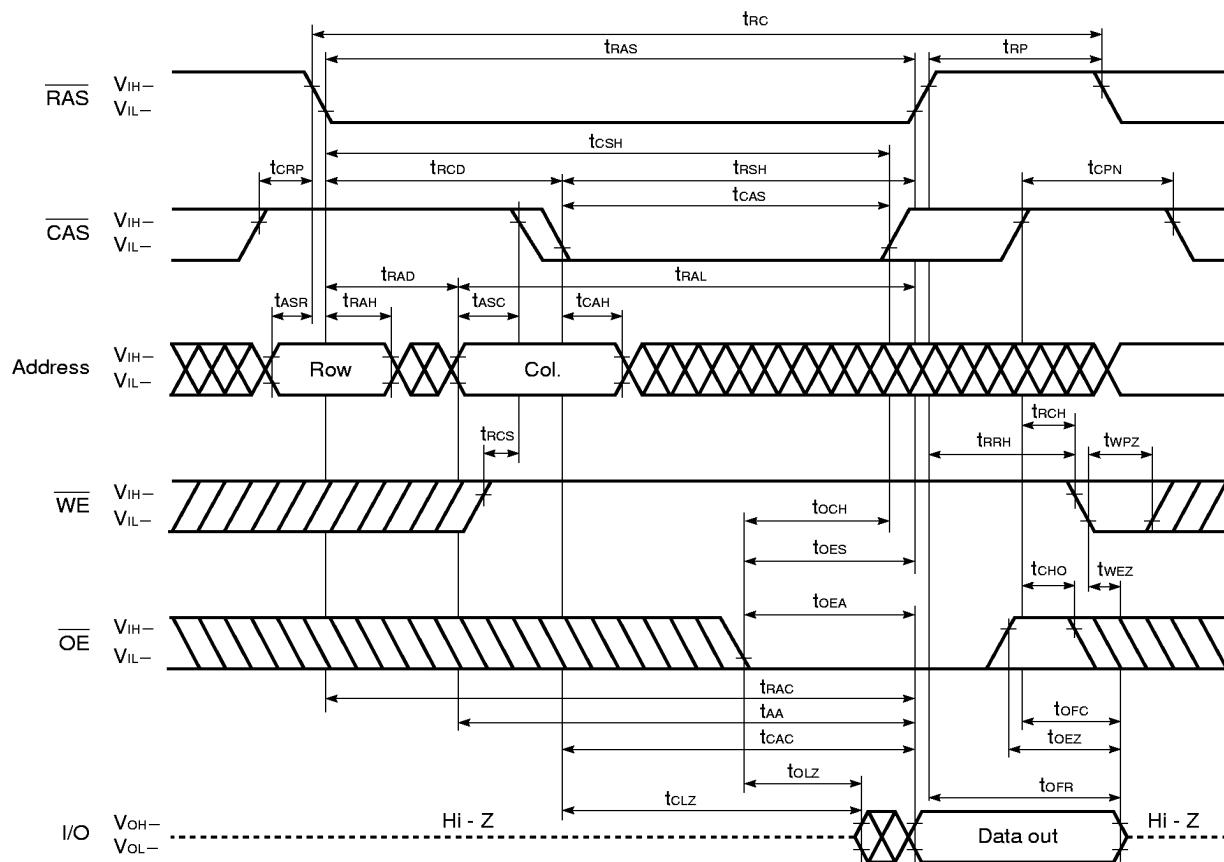

The faster of (1) and (2) becomes effective.

**CAS Before RAS Self Refresh Cycle (Only for the  $\mu$ PD42S16405)**

**Remark** Address,  $\overline{OE}$  : Don't care    I/O : Hi-Z

**Cautions on Use of CAS Before RAS Self Refresh**

$\overline{CAS}$  before  $\overline{RAS}$  self refresh can be used independently when used in combination with distributed  $\overline{CAS}$  before  $\overline{RAS}$  long refresh; However, when used in combination with burst  $\overline{CAS}$  before  $\overline{RAS}$  long refresh or with long  $\overline{RAS}$  only refresh (both distributed and burst), the following cautions must be observed.

**(1) Normal Combined Use of  $\overline{CAS}$  Before  $\overline{RAS}$  Self Refresh and Burst  $\overline{CAS}$  Before  $\overline{RAS}$  Long Refresh**

When  $\overline{CAS}$  before  $\overline{RAS}$  self refresh and burst  $\overline{CAS}$  before  $\overline{RAS}$  long refresh are used in combination, please perform  $\overline{CAS}$  before  $\overline{RAS}$  refresh 4,096 times within a 64 ms interval just before and after setting  $\overline{CAS}$  before  $\overline{RAS}$  self refresh.

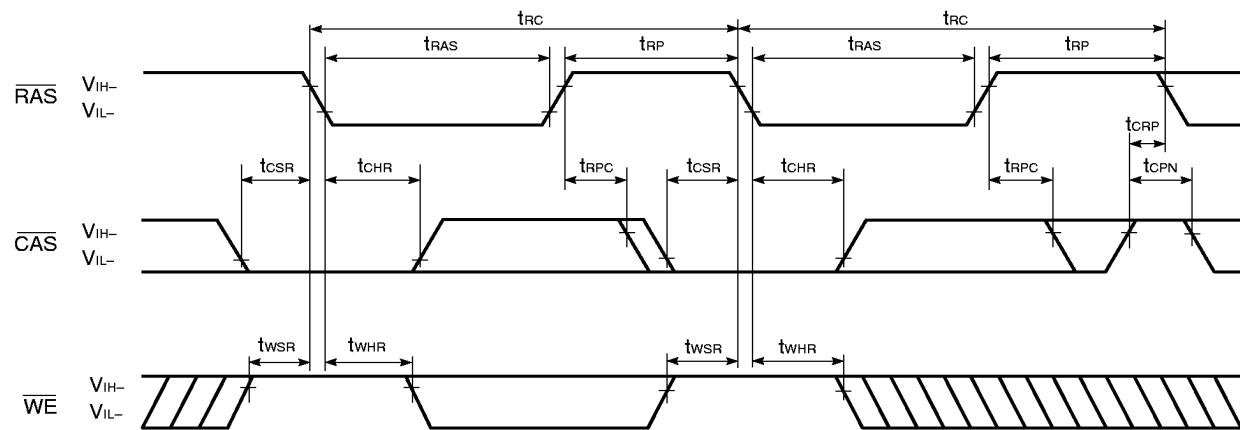

**(2) Normal Combined Use of  $\overline{CAS}$  Before  $\overline{RAS}$  Self Refresh and Long  $\overline{RAS}$  Only Refresh**

When  $\overline{CAS}$  before  $\overline{RAS}$  self refresh and  $\overline{RAS}$  only refresh are used in combination, please perform  $\overline{RAS}$  only refresh 4,096 times within a 64 ms interval just before and after setting  $\overline{CAS}$  before  $\overline{RAS}$  self refresh.

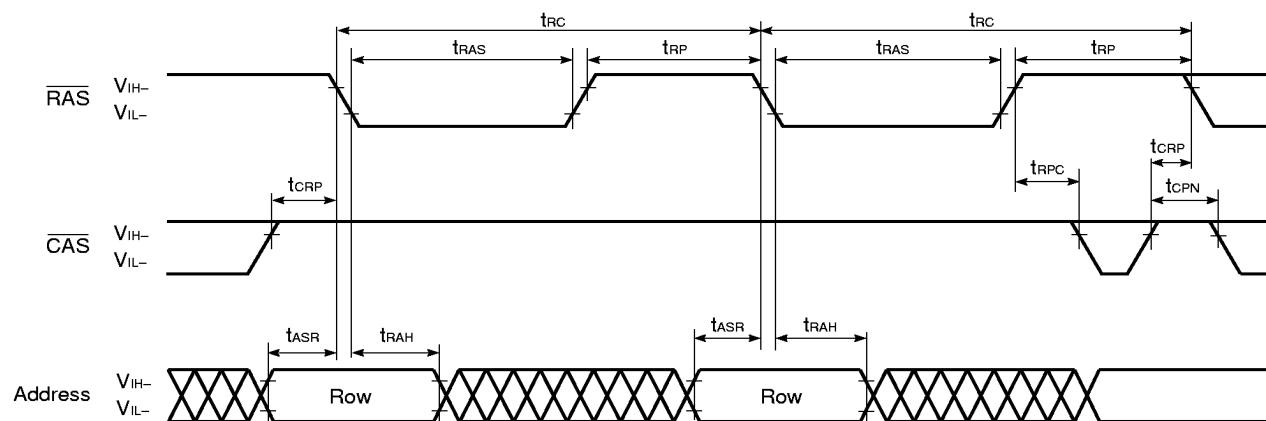

**(3) If  $t_{RASS(MIN.)}$  is not satisfied at the beginning of  $\overline{CAS}$  before  $\overline{RAS}$  self refresh cycles ( $t_{RAS} < 100 \mu s$ ),  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycles will be executed one time.**

If  $10 \mu s < t_{RAS} < 100 \mu s$ ,  $\overline{RAS}$  precharge time for  $\overline{CAS}$  before  $\overline{RAS}$  self refresh ( $t_{RPS}$ ) is applied. And refresh cycles (4,096/128 ms) should be met.

For details, please refer to **How to use DRAM User's Manual**.

**Test Mode Set Cycle ( $\overline{WE}$ ,  $\overline{CAS}$  Before  $\overline{RAS}$  Refresh Cycle)**

**Remark** Address,  $\overline{OE}$ : Don't care I/O: Hi-Z

**Test Mode**

By using the test mode, the test time can be reduced. The reason for this is that, the memory emulates the  $\times 16$ -bit organization during test mode. Don't care about the input levels of the  $\overline{CAS}$  input A0, A1.

**(1) Setting the mode**

Executing the test mode cycle ( $\overline{WE}$ ,  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle) sets the test mode.

**(2) Write/read operation**

When either a "0" or a "1" is written to the input pin in test mode, this data is written to 16 bits of memory cell.

Next, when the data is read from the output pin at the same address, the cell can be checked.

Output = "1": Normal write (all memory cells)

Output = "0": Abnormal write

**(3) Refresh**

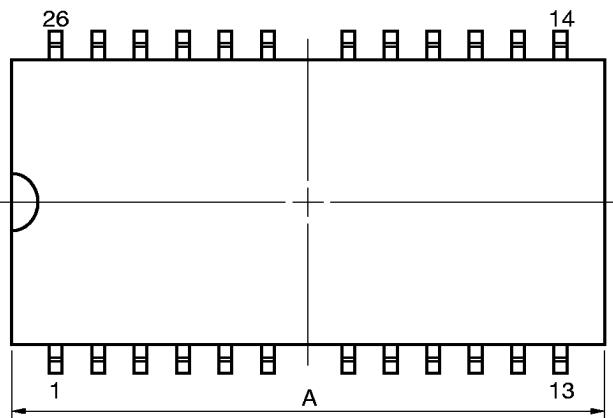

Refresh in the test mode must be performed with the  $\overline{RAS}$  /  $\overline{CAS}$  cycle or with the  $\overline{WE}$ ,  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle. The  $\overline{WE}$ ,  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle use the same counter as the  $\overline{CAS}$  before  $\overline{RAS}$  refresh's internal counter.

**(4) Mode Cancellation**

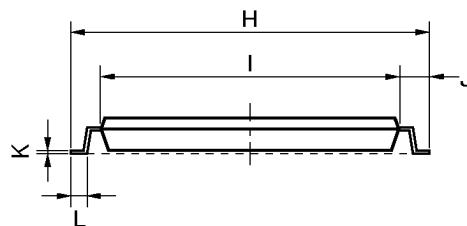

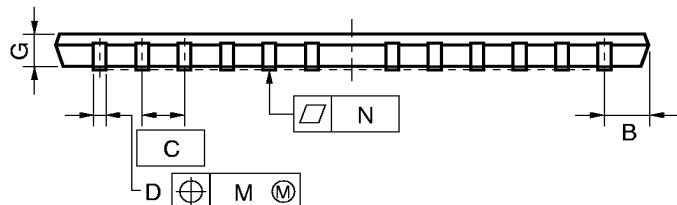

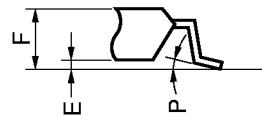

The test mode is cancelled by executing one cycle of  $\overline{RAS}$  only refresh cycle or  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle.

## ★ Recommended Soldering Conditions

The following conditions (see tables below and next page) must be met for soldering conditions of the  $\mu$ PD42S16405, 4216405.

For more details, refer to our document "SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL" (C10535E).

Please consult with our sales offices in case other soldering process is used, or in case the soldering is done under different conditions.

### Types of Surface Mount Device
