

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

DESCRIPTION

The MH8S64DALD is 8388608 - word by 64-bit Synchronous DRAM module. This consists of eight industry standard 8Mx8 Synchronous DRAMs in TSOP and one industry standard EEPROM in TSSOP.

The mounting of TSOP on a card edge Dual Inline package provides any application where high densities and large quantities of memory are required.

This is a socket type - memory modules, suitable for easy interchange or addition of modules.

FEATURES

| | Frequency | CLK Access Time (Component SDRAM) |
|----|-----------|--------------------------------------|
| -6 | 133MHz | 5.4ns(CL=3) |
| -7 | 100MHz | 6.0ns(CL=2) |
| -8 | 100MHz | 6.0ns(CL=3) |

- Utilizes industry standard 8M x 8 Synchronous DRAMs TSOP and industry standard EEPROM in TSSOP
- 168-pin (84-pin dual in-line package)
- single 3.3V±0.3V power supply
- Max. Clock frequency -6:133MHz,-7,8:100MHz
- Fully synchronous operation referenced to clock rising edge
- 4 bank operation controlled by BA0,1(Bank Address)
- /CAS latency- 2/3(programmable)
- Burst length- 1/2/4/8/Full Page(programmable)
- Burst type- sequential / interleave(programmable)
- Column access - random
- Auto precharge / All bank precharge controlled by A10
- Auto refresh and Self refresh
- 4096 refresh cycle /64ms
- LVTTTL Interface
- Discrete IC and module design conform to PC100/PC133 specification.

APPLICATION

PC main memory

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

PIN FUNCTION

| | | |
|-------------------|--------------|--|
| CK (CK0 ~ CK3) | Input | Master Clock:All other inputs are referenced to the rising edge of CK |
| CKE0 | Input | Clock Enable:CKE controls internal clock.When CKE is low,internal clock for the following cycle is ceased. CKE is also used to select auto / self refresh. After self refresh mode is started, CKE becomes asynchronous input.Self refresh is maintained as long as CKE is low. |
| /S (/S0,2) | Input | Chip Select: When /S is high,any command means No Operation. |
| /RAS,/CAS,/WE | Input | Combination of /RAS,/CAS,/WE defines basic commands. |
| A0-11 | Input | A0-11 specify the Row/Column Address in conjunction with BA.The Row Address is specified by A0-11.The Column Address is specified by A0-8.A10 is also used to indicate precharge option.When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged. |
| BA0,1 | Input | Bank Address:BA0,1 is not simply BA.BA specifies the bank to which a command is applied.BA0,1 must be set with ACT,PRE,READ,WRITE commands |
| DQ0-63 | Input/Output | Data In and Data out are referenced to the rising edge of CK |
| DQMB0-7 | Input | Din Mask/Output Disable:When DQMB is high in burst write.Din for the current cycle is masked.When DQMB is high in burst read,Dout is disabled at the next but one cycle. |
| Vdd,Vss | Power Supply | Power Supply for the memory mounted module. |
| SCL | Input | Serial clock for serial PD |
| SDA | Output | Serial data for serial PD |
| SA0-3 | Input | Address input for serial PD |

BASIC FUNCTIONS

The MH8S64DALD provides basic functions, bank(row) activate, burst read / write, bank(row) precharge, and auto / self refresh.

Each command is defined by control signals of /RAS, /CAS and /WE at CK rising edge. In addition to 3 signals, /S, CKE and A10 are used as chip select, refresh option, and precharge option, respectively.

To know the detailed definition of commands please see the command truth table.

Activate(ACT) [/RAS =L, /CAS = /WE =H]

ACT command activates a row in an idle bank indicated by BA.

Read(READ) [/RAS =H, /CAS =L, /WE =H]

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read(auto-precharge, **READA**).

Write(WRITE) [/RAS =H, /CAS = /WE =L]

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write(auto-precharge, **WRITEA**).

Precharge(PRE) [/RAS =L, /CAS =H, /WE =L]

PRE command deactivates the active bank indicated by BA. This command also terminates burst read / write operation. When A10 =H at this command, both banks are deactivated(precharge all, **PREA**).

Auto-Refresh(REFA) [/RAS =/CAS =L, /WE =CKE =H]

REFA command starts auto-refresh cycle. Refresh address including bank address are generated internally. After this command, the banks are precharged automatically.

ABBREVIATIONS:

H = High Level, L = Low Level, X = Don't Care

BA = Bank Address, RA = Row Address, CA = Column Address, NOP = No Operation

NOTES:

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and / or data-integrity are not guaranteed.

FUNCTION TRUTH TABLE FOR CKE

ABBREVIATIONS:

H = High Level, L = Low Level, X = Don't Care

NOTES:

1. CKE Low to High transition will re-enable CK and other inputs **asynchronously**. A minimum setup time must be satisfied before any command other than EXIT.
2. Power-Down and Self-Refresh can be entered only from the All banks idle State.
3. Must be legal command.

SIMPLIFIED STATE DIAGRAM

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

POWER ON SEQUENCE

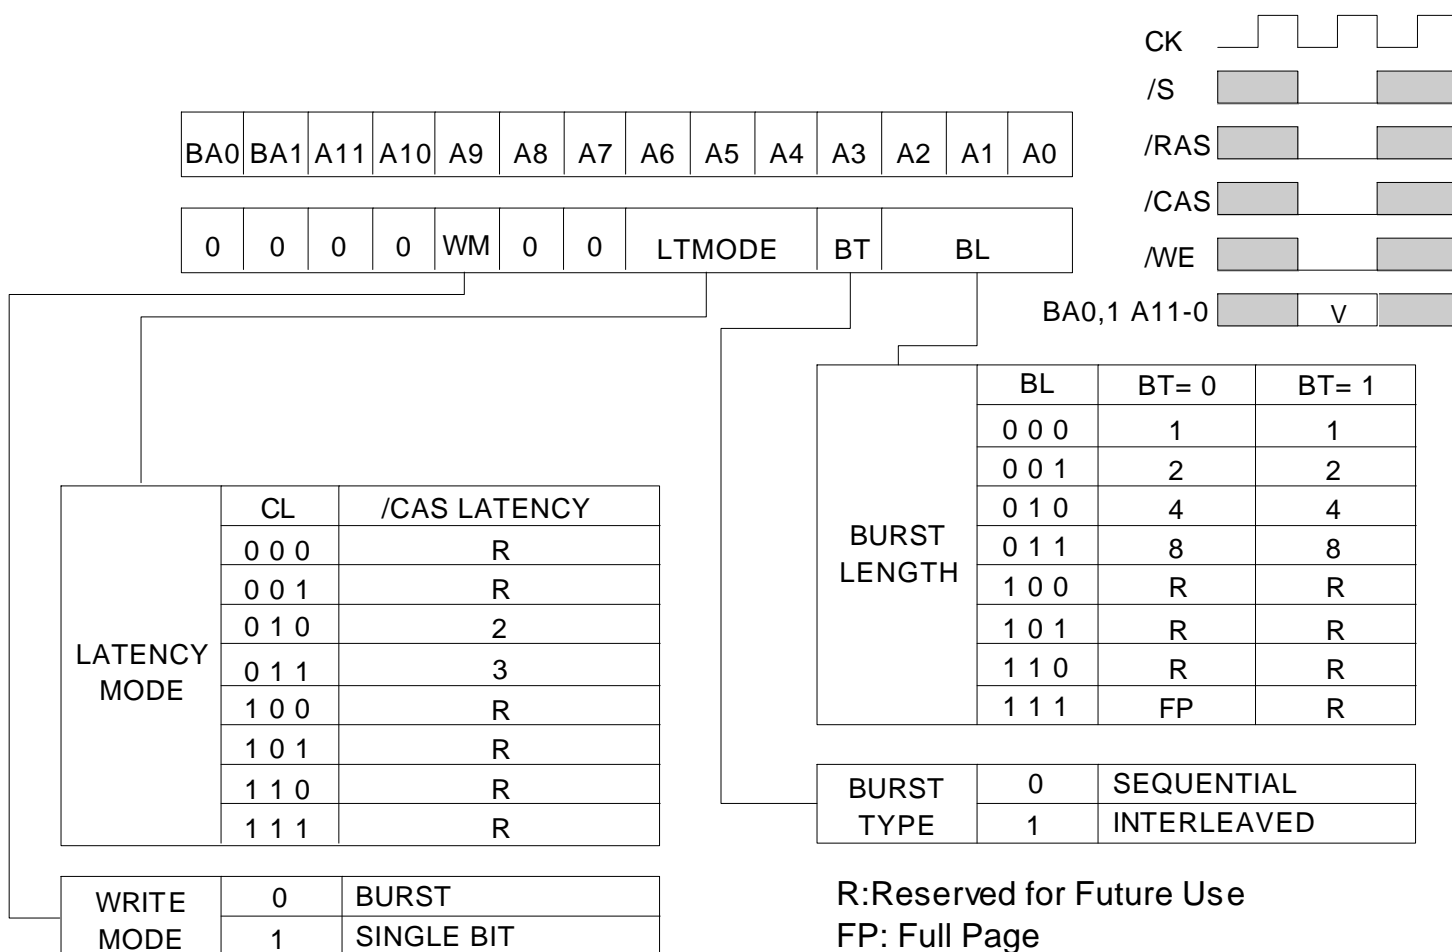

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or malfunctioning.

1. Apply power and start clock. Attempt to maintain CKE high, DQMB0-7 high and NOP condition at the inputs.
2. Maintain stable power, stable clock, and NOP input conditions for a minimum of 200us.
3. Issue precharge commands for all banks. (PRE or PREA)
4. After all banks become idle state (after tRP), issue 8 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.

After these sequence, the SDRAM is idle state and ready for normal operation.

MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register(MRS). The mode register stores these data until the next MRS command, which may be issue when both banks are in idle state. After tRSC from a MRS command, the SDRAM is ready for new command.

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

OPERATION DESCRIPTION

BANK ACTIVATE

One of four banks is activated by an ACT command.
 An bank is selected by BA0-1. A row is selected by A0-11.
 Multiple banks can be active state concurrently by issuing multiple ACT commands.
 Minimum activation interval between one bank and another bank is tRRD.

PRECHARGE

An open bank is deactivated by a PRE command.
 A bank to be deactivated is designated by BA0-1.
 When multiple banks are active, a precharge all command (PREA, PRE + A10=H) deactivates all of open banks at the same time. BA0-1 are "Don't Care" in this case.
 Minimum delay time of an ACT command after a PRE command to the same bank is tRP.

READ

A READ command can be issued to any active bank. The start address is specified by A0-8 (x8) . 1st output data is available after the /CAS Latency from the READ. The consecutive data length is defined by the Burst Length. The address sequence of the burst data is defined by the Burst Type. Minimum delay time of a READ command after an ACT command to the same bank is tRCD.

When A10 is high at a READ command, auto-precharge (READA) is performed. Any command (READ, WRITE, PRE, ACT, TBST) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at the BL after READA. The next ACT command can be issued after (BL + tRP) from the previous READA. In any case, tRCD+BL ≥ tRASmin must be met.

Auto-Precharge Timing (READ BL=4)

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

WRITE

A WRITE command can be issued to any active bank. The start address is specified by A0-8 (x8). 1st input data is set at the same cycle as the WRITE. The consecutive data length to be written is defined by the Burst Length. The address sequence of burst data is defined by the Burst Type. Minimum delay time of a WRITE command after an ACT command to the same bank is t_{RCD} . From the last input data to the PRE command, the write recovery time (t_{WR}) is required. When A10 is high at a WRITE command, auto-precharge (WRITEEA) is performed. Any command (READ, WRITE, PRE, ACT, TBST) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at t_{WR} after the last input data cycle. The next ACT command can be issued after $(BL + t_{WR} - 1 + t_{RP})$ from the previous WRITEEA. In any case, $t_{RCD} + BL + t_{WR} - 1 \geq t_{RASmin}$ must be met.

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

BURST INTERRUPTION

[Read Interrupted by Read]

Burst read operation can be interrupted by new read of the same or the other bank. Random column access is allowed READ to READ interval is minimum 1 CK

Read Interrupted by Read (BL=4, CL=2)

[Read Interrupted by Write]

Burst read operation can be interrupted by write of any active bank. Random column access is allowed. In this case, the DQ should be controlled adequately by using the DQMB0-7 to prevent the bus contention. The output is disabled automatically 1 cycle after WRITE assertion.

Read Interrupted by Write (BL=4, CL=2)

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

[Read Interrupted by Precharge]

A burst read operation can be interrupted by precharge of *the same bank*. Read to PRE interval is minimum 1 CK. A PRE command output disable latency is equivalent to the /CAS Latency.

Read Interrupted by Precharge (BL=4)

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

[Read Interrupted by Burst Terminate]

Similarly to the precharge, burst terminate command can interrupt burst read operation and disable the data output. The terminated bank remains active, READ to TBST interval is minimum of 1 CK. A TBST command to output disable latency is equivalent to the /CAS Latency.

Read Interrupted by Terminate (BL=4)

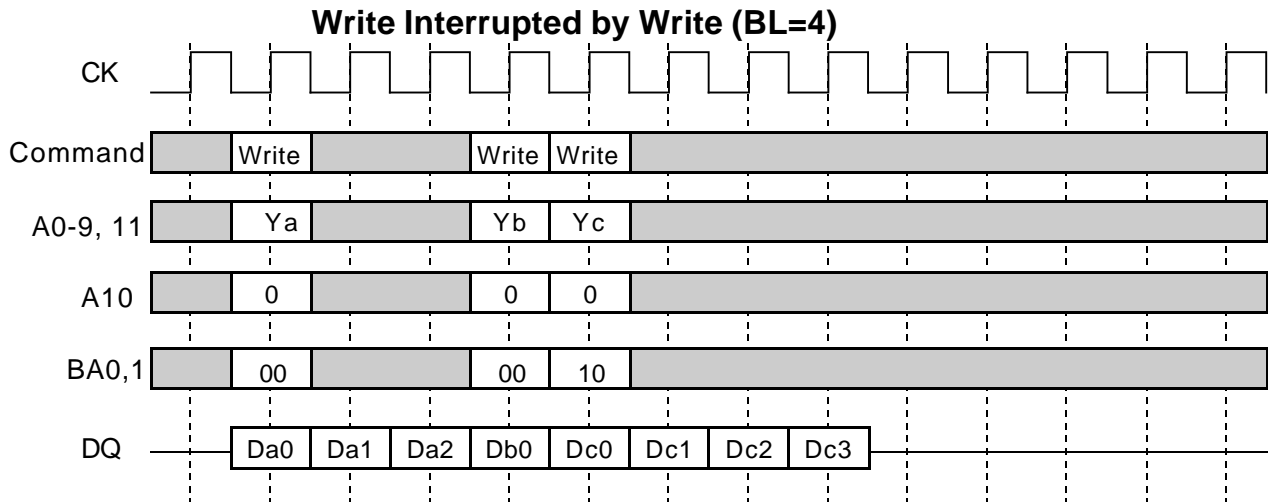

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

[Write Interrupted by Write]

Burst write operation can be interrupted by new write of any active bank. Random column access is allowed. WRITE to WRITE interval is minimum 1 CK.

[Write Interrupted by Read]

Burst write operation can be interrupted by read of any active bank. Random column access is allowed. WRITE to READ interval is minimum 1 CK. The input data on DQ at the interrupting READ cycle is "don't care".

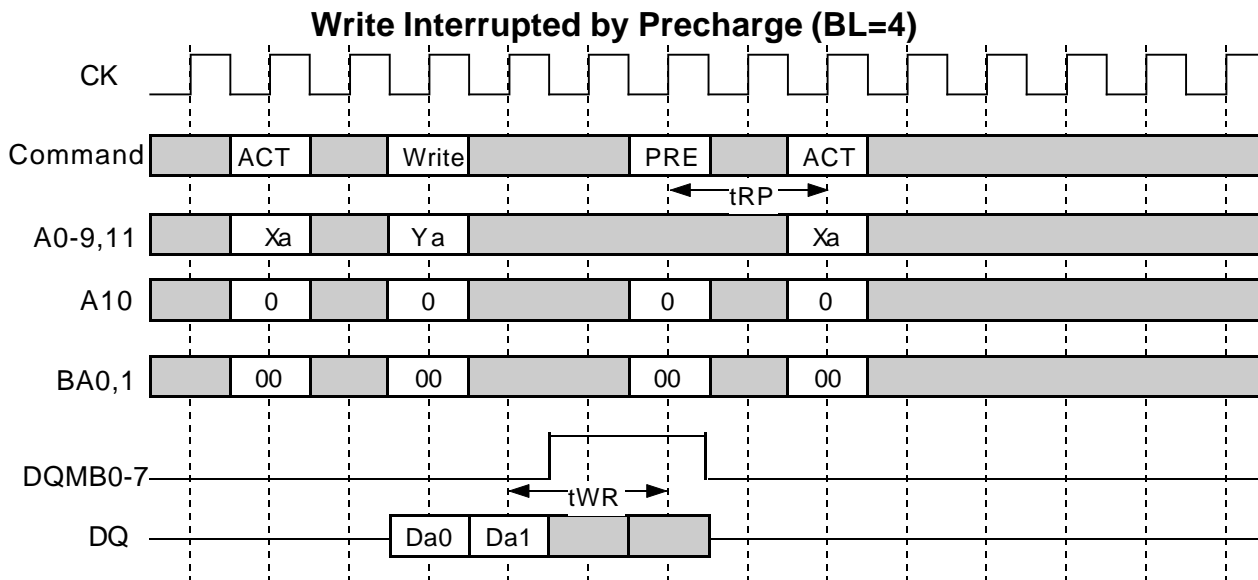

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

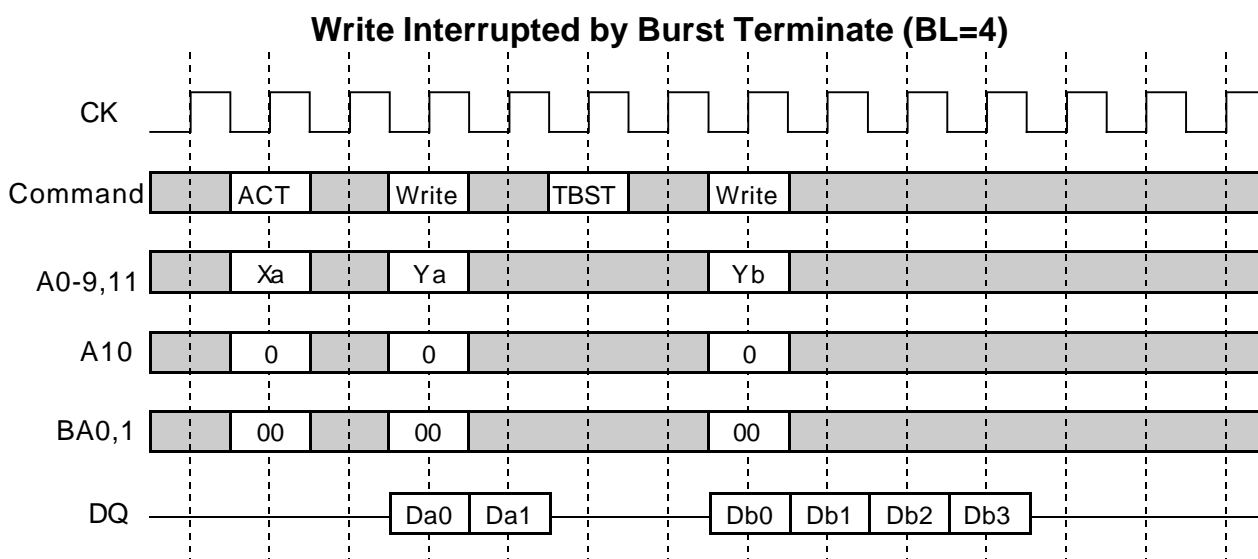

[Write Interrupted by Precharge]

Burst write operation can be interrupted by precharge of *the same bank*. Write recovery time(t_{WR}) is required from the last data to PRE command. During write recovery, data inputs must be masked by DQM.

[Write Interrupted by Burst Terminate]

Burst terminate command can terminate burst write operation. In this case, the write recovery time is not required and the bank remains active. The WRITE to TBST minimum interval is 1CK.

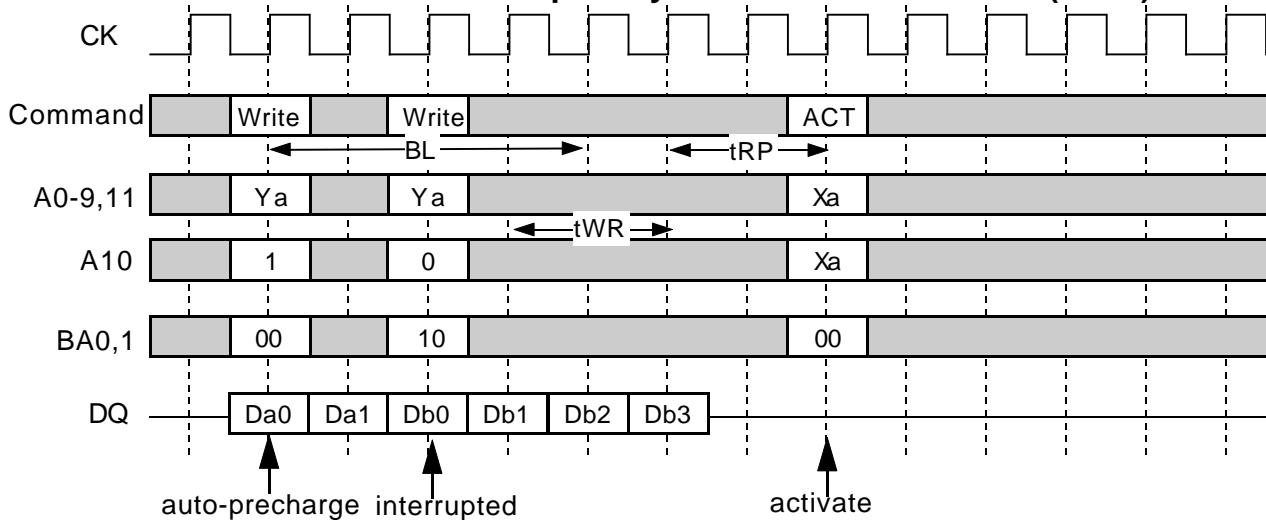

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

[Write with Auto-Precharge interrupted by Write or Read to another Bank]

Burst write with auto-precharge can be interrupted by write or read to *another bank*. Next ACT command can be issued after (BL+tWR-1+tRP) from the WRITEEA. Auto-precharge interrupted by a command to the same bank is inhibited.

WRITEEA Interrupted by WRITE to another bank (BL=4)

WRITEEA interrupted by READ to another bank (CL=2, BL=4)

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

[Read with Auto-Precharge interrupted by Read to another Bank]

Burst read with auto-precharge can be interrupted by read to *another bank*. Next ACT command can be issued after (BL+tRP) from the READA. Auto-precharge interrupted by a command to the same bank is inhibited.

Full Page Burst

Full page burst length is available for only the sequential burst type. Full page burst read or write is repeated until a Precharge or a Burst Terminate command is issued. In case of the full page burst, a read or write with auto-precharge command is illegal.

Single Write

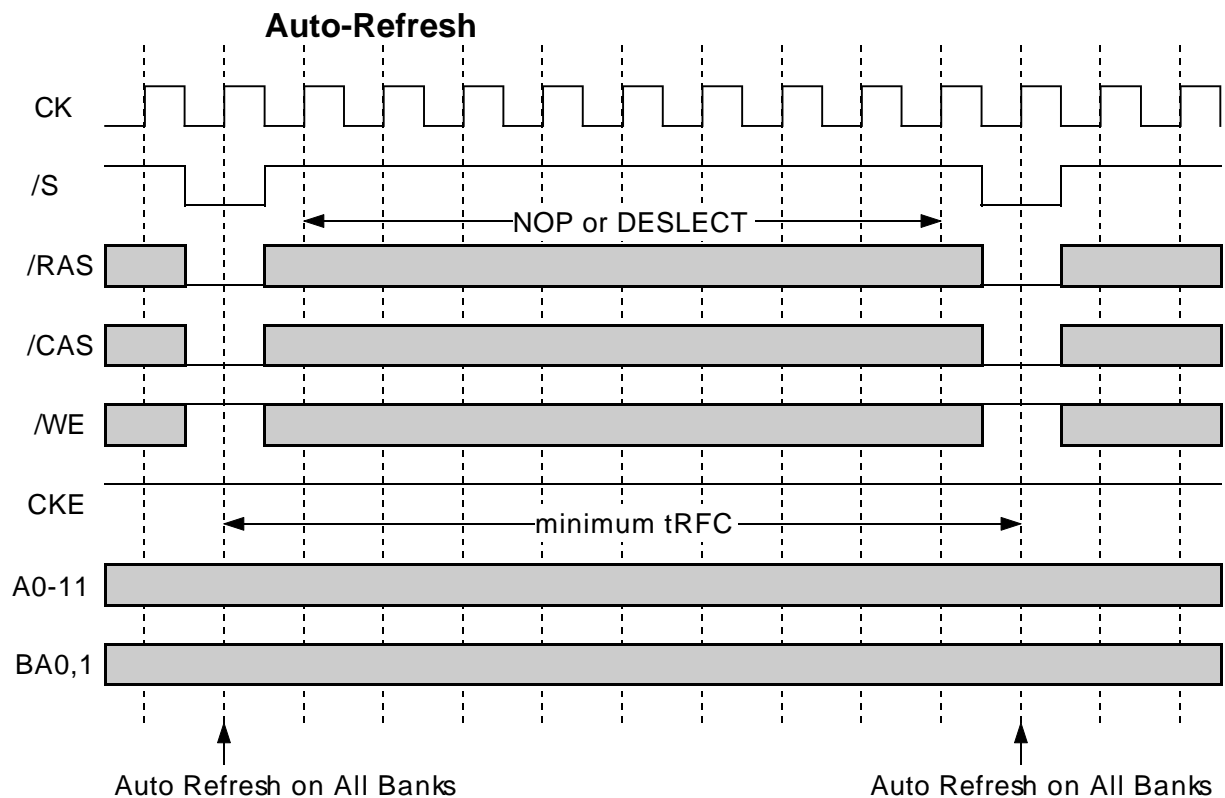

When single write mode is set, burst length for write is always one, independently of Burst Length defined by (A2-0).

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

AUTO REFRESH

Single cycle of auto-refresh is initiated with a REFA(/CS=/RAS=/CAS=L, /WE=/CKE=H) command. The refresh address is generated internally. 4096 REFA cycle within 64ms refresh 64Mbit memory cells. The auto-refresh is performed on 4banks concurrently. Before performing an auto-refresh, all banks must be in the idle state. Auto-refresh to auto-refresh interval is minimum tRFC. Any command must not be issued before tRFC from the REFA command.

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

SELF REFRESH

Self-refresh mode is entered by issuing a REFS command (/CS=/RAS=/CAS=L, /WE=H, CKE=L). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enabled input, all other inputs including CK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CK inputs, asserting DESEL or NOP command and then asserting CKE=H. After tRFC from the 1st CK edge following CKE=H, all banks are in the idle state and a new command can be issued after, but DESEL or NOP commands must be asserted till then.

MH8S64DALD -6,-7,-8

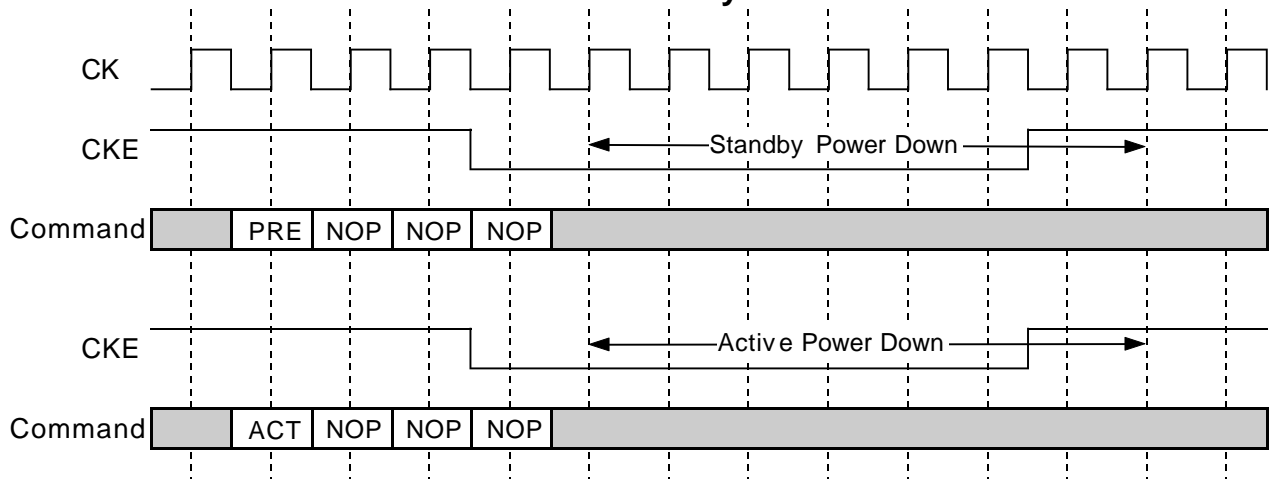

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

CLK SUSPEND and POWER DOWN

CKE controls the internal CLK at the following cycle. Figure below shows how CKE works. By negating CKE, the next internal CLK is suspended. The purpose of CLK suspend is power down, output suspend or input suspend. CKE is a synchronous input except during the self-refresh mode. CLK suspend can be performed either when the banks are active or idle. A command at the suspended cycle is ignored.

Power Down by CKE

DQ Suspend by CKE

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

DQM CONTROL

DQMB0-7 is a dual function signal defined as the data mask for writes and the output disable for reads. During writes, DQMB0-7 masks input data word by word. DQMB0-7 to Data In latency is 0.

During reads, DQMB0-7 forces output to Hi-Z word by word. DQMB0-7 to output Hi-Z latency is 2.

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Page Mode Burst Write (multi bank) @BL=4

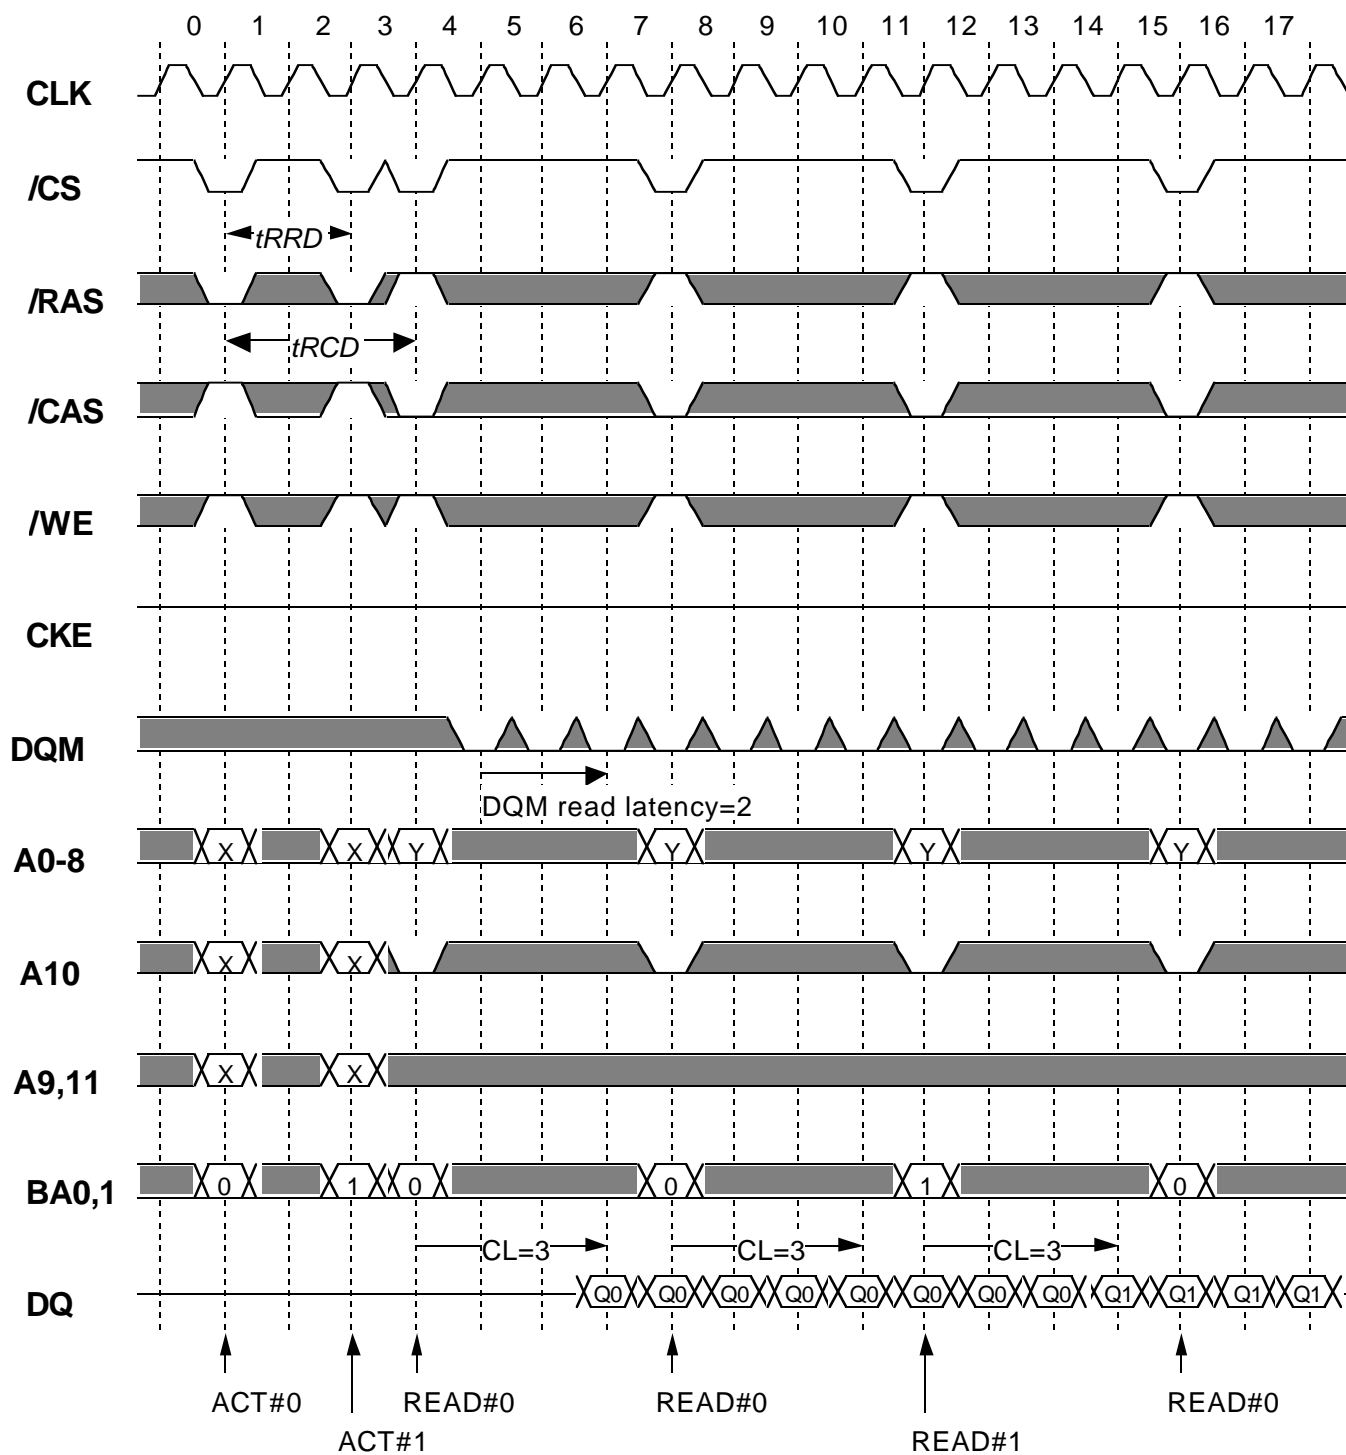

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Page Mode Burst Read (multi bank) @BL=4 CL=3

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Write Interrupted by Write / Read @BL=4

Burst Write can be interrupted by Write or Read of any active bank.

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Read Interrupted by Read / Write @BL=4 CL=3

Burst Read can be interrupted by Read or Write of any active bank

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Write Interrupted by Precharge @BL=4

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Read Interrupted by Precharge @BL=4 CL=3

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Mode Register Setting

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Auto-Refresh @BL=4

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Self-Refresh

Before Self-Refresh Entry,
all banks must be idle state.

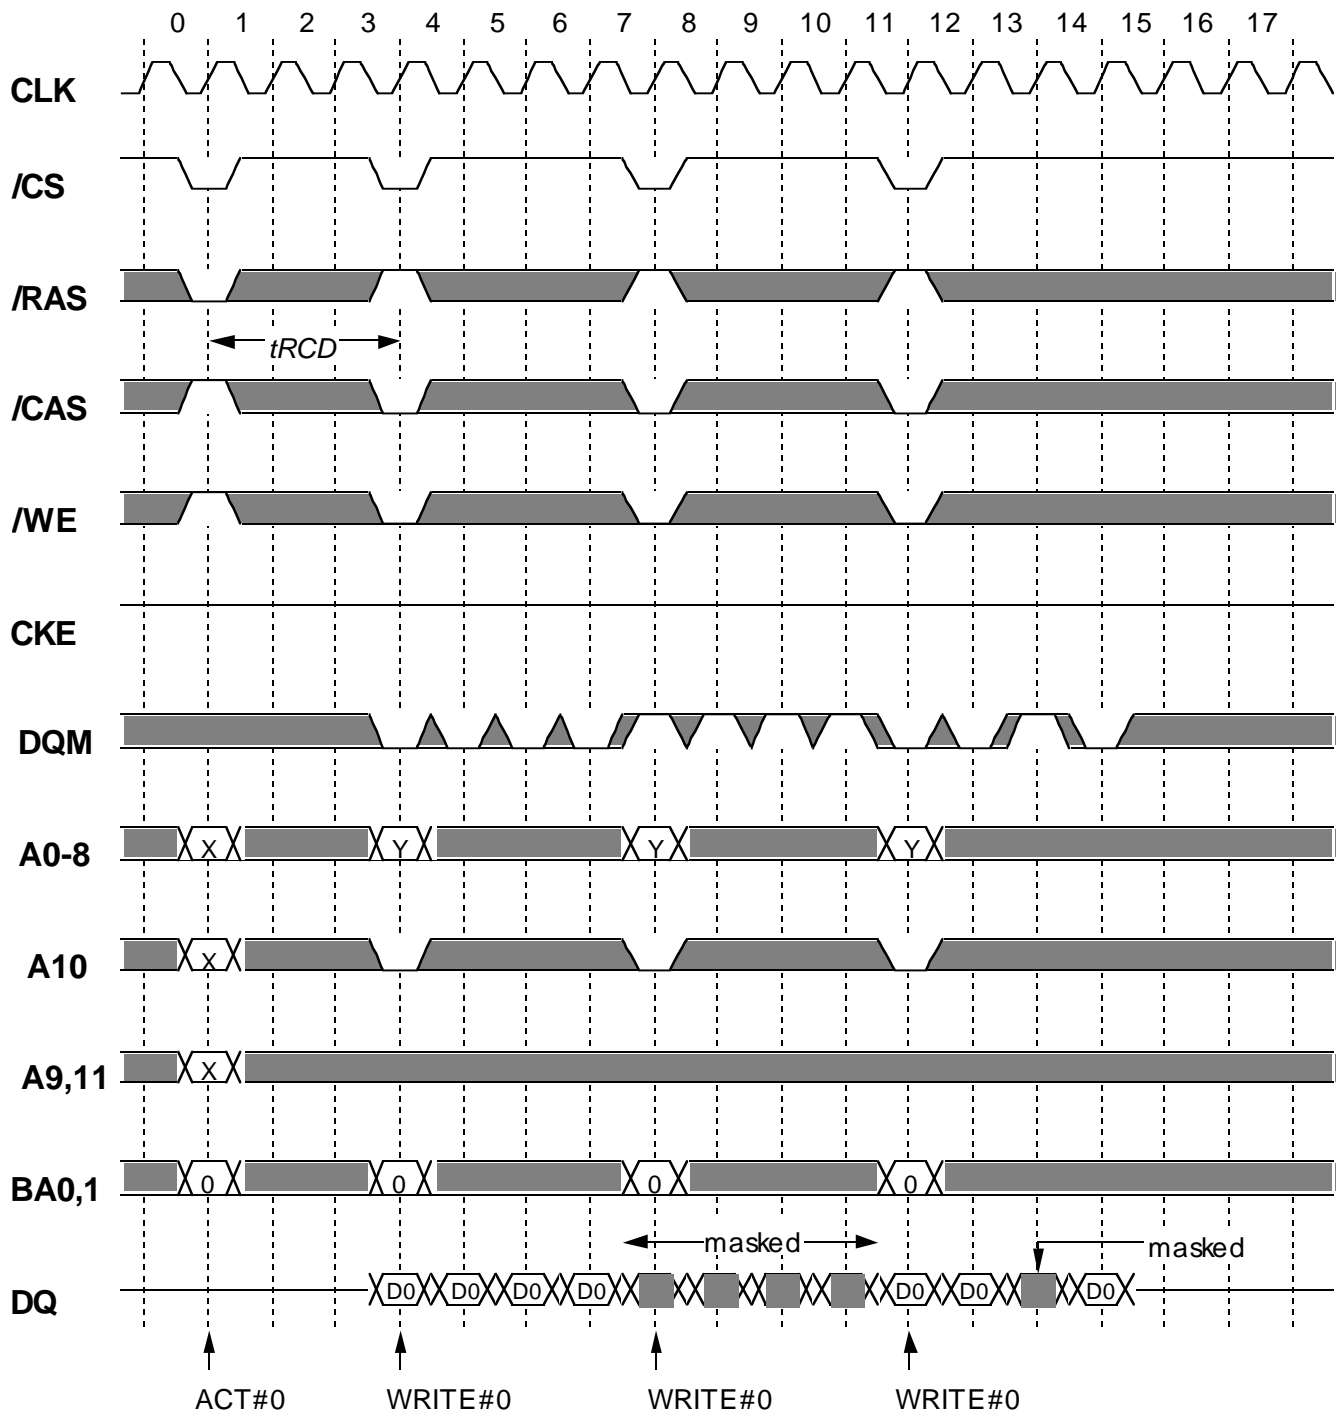

After t_{RC} from Self-Refresh Exit,
all banks are idle state.

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

DQM Write Mask @BL=4

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT)Synchronous DRAM

DQM Read Mask @BL=4 CL=3

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

Power Down

Italic parameter indicates minimum case

MH8S64DALD -6,-7,-8

536870912-BIT (8388608 - WORD BY 64-BIT) Synchronous DRAM

CLK Suspend @BL=4 CL=3

Italic parameter indicates minimum case

Keep safety first in your circuit designs!

Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
2. Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
4. Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for special applications, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
5. The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
6. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
7. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
